Continuing his questions, Prof. Davis asks how the polar whirl came by its persistent habit, and answers that the earth, the moon, the sun, Mars, Jupiter and Saturn all turn from right to left. Astronomical speculators have supposed that all the planets once existed as rings of thinly scattered matter around the sun, and that these rings were annular segregations from a vague, irregularly scattered mass that turned one way in spiral courses, thus determining the direction in which the rings revolved, and all the rest from this. But why did nebula turn? It grew from chaos; and chaos possessed, presumably, some motion turning from right to left, and from that time to this, through sun, moon, planets, winds, cyclones and tornadoes, the habit then established has never been changed.—*Exchange.*

INTERESTING DISCOVERY.—Some very interesting remains of an early dwelling-place have recently been discovered a few feet above tide water at Wolfville, Nova Scotia. The discover-

ery was made by removing about six feet of sand from the top of a little hillock. In digging away the sand, the workmen came unexpectedly upon what was evidently the remains of a house. The relics unearthed were as follows: A floor of hewn boards, probably hemlock, charred on upper side; rough bricks or irregular pieces of clay reddened and hardened by fire; charcoal, or charred wood, and sticks which may have been wattles; iron implements, as wrought nails, file, knife, and portions of vessels; copper coin and gun guard; small pieces of crockery, a bowl of clay pipe two inches high, and several stems. There was evidently a small house here at some remote period, which was hurried down, and the site of which has since been covered by six feet of sand. The remains were undoubtedly of very early origin; but it is difficult to say whether they belong to the Acadian or Norse period.

HOW MOUNTAINS WERE MADE.—Foremost in their geographical importance, and in the intricacy and significance of their geological structure and origin, according to Professor Warren Upham, are the mountain belts, which consist of folded rock formations. The strata forming the upper part of the earth's crust are bent up and down in long, nearly straight or curving, wave-like ridges and troughs, and where their disturbance was greatest, the successive ridged folds are closely pressed together. The waves of the rock structure are then pushed to such steepness that their sides become parallel with each other, and the entire fold is driven forward into an inclined position. The order of the strata on the lower side of the appressed fold is thus inverted; the originally highest and last formed deposits there lie beneath older beds, in an overturned series. Subsequent erosion then wears down the undulations and the crests of the closely formed strata, often planing them off until a long section, crossing mountain ranges, passes from older to newer beds, and onward from newer to older, in several alternations, having throughout the whole a nearly constant steep dip. Owing to the interbedding of hard and enduring sandstone, quartzite, gneiss, and other rock formations, with more easily eroded limestone, shales, incoherent sandstones, or schists, the erosion commonly produces a new topography, making hollows and long valleys where the more erosive beds have been removed, and leaving ridges and mountain ranges of the harder rocks. Moreover, when erosion has been continued through very long periods, it tends toward the ultimate result of removing the upward curved or anticlinal portions of the great folds, and sparing the originally lower downward curved or synclinal portions, until valleys take the places which were originally occupied by the highest upheavals, while the original troughs, where the rocks were most compact by pressure, remain now as the principal mountain ridges.

ASTRONOMICAL PROGRESS.—In his recent address as President of the British Association for the Advancement of Science, Dr. Williams-Huggins stated that it is now some 30 years since the spectroscopic gave us for the first time certain knowledge of the nature of the heavenly bodies, and revealed the fundamental fact that terrestrial matter is not peculiar to the solar system, but is common to all the stars visible to us. This instrument has in this time analyzed the stars, though it has thus far failed to interpret the remarkable spectrum of the Aurora Borealis, and to teach much of the physical and chemical nature of the sun's corona. It has shown reasons for arranging the stars in a series in which the different temperatures seem to be indicated and to denote different stages of evolution, our sun occupying a place near the middle of the series. It has given us a means of determining that some stars are approaching and some receding in the line of sight, and of measuring the rate, though the nearest star is so remote that its approach at the rate of 100 miles per second would not increase its light one-fortieth in a century. The motions of about 50 stars have been thus determined, with an accuracy of about an English mile per second. Indeed, a number of measures of the star Arcturus have been made by Keeler, with variation of not more than six-tenths of a mile per second, these being determinations of the motions of a remote sun by means of light waves which have been nearly 200 years upon their journey. Nebulae have been seen to move at about the same rates as the stars—from two to 27 miles per second, and in one case 40 miles. Photography, which has rendered wonderful help to the astronomer in other ways, has aided in these researches.

ELECTROLYTIC BLEACHING.—A method of electrolytic bleaching has lately been patented in Germany, which consists in passing the textile or other material to be bleached between rolls serving as anode and cathode respectively, the electrolyte being used to saturate the fabric itself. Several pairs of rolls can be used, the anode and cathode being alternately the upper, so that both sides of the stuff are subjected to the bleaching action of the products of electrolysis.

NITRATE OF POTASH, called saltpeter, is said to hold in one volume as much oxygen as 3000 volumes of ordinary atmospheric air. Hence it has been called "a magazine of oxygen in a solidified form."

LIGHT IN DEEP WATER.—Clear summer sunlight is said to penetrate the Mediterranean sea to a depth of 1200 feet.

ELECTRICITY.

Electricity in Mining.

The introduction of electric devices into mining work is making rapid and most satisfactory progress. Mr. Edison is just at this time, among the multiplicity of his other labors, giving much attention to the benefits which can be obtained from electricity in this direction. In regard to the general advantages of the use of electricity for furnishing light and power in mines, there can be no question. Such use of this new power is applicable to every kind of mining.

But the especial researches of this distinguished man, at the present time, are being directed to the treatment of iron ores. He was recently in Chicago, and in reference to this matter is reported to have said:

"Electrical mining is making progress. We have invaded New York State; we have leased from the Reading road the great iron-ore deposits of Canopus valley, near Peekskill; we have purchased from Senator Jones of Nevada the small railroad, six miles long, running up the valley; we are extending it for miles, and are building concentrating works for purifying by electricity the large bodies of poor iron ore. The ore is of a poor grade, but there is an enormous deposit of it, and, though, it is too low in grade to pay for working it direct, by working it through our process we will make it all right.

"This electric mining is my biggest scheme. It is a tremendous change in the methods of separating iron ore. Under our process we find that the yield is enough to pay.

"One and a half million tons of this class of ore are imported annually from Spain, Algiers and Cuba. We must pay about \$4,000,000 or \$5,000,000 every year to Spain and Cuba for that ore. What is the use? We have got it right here. All it wants is sand to go ahead and get it out."

These statements, coming from such a source, is a matter of great interest everywhere, and in no other locality is it of more interest than in California. We have here some of the finest bodies of iron ore in the world. They are found in almost every portion of the State, easily accessible, of high percentage, and of just the character most needed under the present systems of iron production and use.

The Fresno *Expositor*, in alluding to the iron-ore deposits in that county, and of Edison's new electric process, says:

"There is no county in California, or in the whole United States, that should hail with as much enthusiasm such an invention as this, as Fresno county. It has everything to gain. From its peculiar condition, it must look to electricity as a developer of mines with more than ordinary solicitude. The great iron deposits of the Minarets are not surpassed in the world. Not even are they equaled. The iron mountains of Norway and Sweden, which have been the source of supply for the commercial world for so long, do not surpass, and it is a question if they equal the iron that forms the range of conical peaks, known as the Minarets, on the head of the San Joaquin river."

That paper further adds: "The two great drawbacks of the development of these deposits of ore have been, first, that fuel for smelting and refining has not been plentiful, and would be expensive. The second has been, that the grade of the ore is so high that it does not work easily. It is of so high grade that in the ordinary furnaces it is refractory; the iron does not flow freely from the ore."

Mr. Edison's process, if his reports can be depended on, remove both these objections. Cheap electricity, developed by water power, furnishes a substitute for the coal, while the electrical treatment separates the iron from the ore, without the drawbacks presented when that same ore is treated in an ordinary furnace with coal. If the statements of Mr. Edison, made in connection with his own special field of research, can be relied upon—if electricity can be made to do the work of coal, and do it cheaper and better, it means a great thing for California and the world.

LONG-DISTANCE TRANSMISSION is about to be tried in Los Angeles county. The San Antonio Light Power Co., near Pomona, will obtain 800-horse power from the Pelton water-wheels, which will be run by water dropped from a height of 360 feet. The power will be transmitted to Pomona, Chino, Ontario and San Bernardino, a distance of nearly or quite 40 miles. This will be considered quite a long distance transmission. The report of percentage of power transmitted over that distance will be looked for with much interest.

THE SOUTHERN PACIFIC will soon try its canny hand on an electric street railway in Oakland. The horse-car line on Telegraph avenue is to give way to an electric road which will be constructed on the most improved plan. The Southern Pacific will own and manage the road, which will be constructed at once. The contract has been let to the Pacific Improvement Co., and this fact alone will insure a speedy completion. An improved rail will be used, which will have flanges on both sides, which it is claimed will constitute an important improvement over the old one-flanged rail, which does so much damage to buggy wheels. It is expected that the road will be running within six

months. The new arrangement will afford more frequent trips and better time, and will have a tendency to increase the value of property all along the line, and make it one of the most popular thoroughfares in Oakland.

Edison's New Electric Railway Device.

The announcements from Mr. Edison of what he has done, or is confident he will do, come so thick and fast that it is difficult for the public mind to keep pace with his work. It is even more difficult to realize the possibility of some of his promises and prophecies; but he seems always to get there and on time.

His last announcement, quite recently made, and already alluded to in these columns, appears to be the most wonderful and far-reaching in its results of any of his previous remarkable discoveries. It is said that he has been engaged on experiments in this direction for two years. He has met with almost insuperable difficulties, but he has stuck to his work with that dogged pertinacity for which he is famous, and at last has been successful.

The general principle of the invention, which is applied to street cars, is that the electric current passes down through one line of rails, is picked up by the car, passes through the motor beneath it, and goes out on the other side and returns through the other line of rails to the central power station.

At the first thought, says the New York *Herald*, the bare idea of this is paradoxical. The question will naturally occur why the electric current does not dissipate itself in the ground. To this no positive reason can be assigned, except the bare statement that it does not. In general terms, the effect is accomplished by having the current one of low voltage or pressure. It is a well settled principle in electrical research that the higher the voltage the greater must be the insulation, and that the lower the voltage can be brought the less need of insulation. Mr. Edison's experiments have all been in this direction—that is to say, in the endeavor to construct a motor sufficiently powerful to do the work, in which the voltage was reduced to so low a point that the natural tendency of the electric current to fly off to the ground and be dissipated would be overcome, and the passage through the motor to the opposite rail would be easier for the current than to pass through the ground to the central station. The voltage is very low, less than 100, while the average voltage of the overhead trolley system is generally in excess of 500.

It is this system which mainly contributes to the success of the long-distance transmission at Frankfort. These two experiments will give some idea of the great revolution in electric transmission and propulsion which is about to be introduced into the use and manipulation of this new power.

One of the most remarkable features of the invention is in the "pick ups," that take the current from one line of rails. A novel and ingenious mechanism has been so arranged that it will work with perfect certainty and effect through several inches of mud or slush or water.

The experiments leading to this result were made on a track a quarter of a mile in length, which presented all the various kinds of difficulties that actual use would encounter. A part of it was laid on a very heavy grade of nearly 300 feet to the mile, with several sharp curves, and a portion of it runs through a sunken spot where the track could be flooded with water or covered with mud. In this way, all the varying conditions of actual use were provided.

The experiments have now been fully completed, and the invention passes out of the first experimental stage into the second stage, its adaptation to practical work. Several prominent horse railroads have offered their lines to the Edison General Electric Company for the introduction of the invention, and it is probable that a selection will be made in the near future and arrangements made to put the first practical experimental line in operation.

ELECTRIC ENGINEERING AT BERKELEY.—A chair of electrical engineering at the University of California, Berkeley, is being arranged for by Prof. Hesse of the Mechanical Engineering Department. Several of the students have made great progress in electrical work, all of the telegraph instruments used by the signal corps—a fire-alarm circuit and system of electric bells for calling off recitation hours—being the work of the students.

FROM SAN JOSE TO LOS GATOS.—Mr. F. Chappelle and others have presented a petition to the Los Gatos Town Board for a franchise for an electric railway, to connect with their Haywards and San Jose line in San Jose. They propose a 15-cent fare to San Jose. The petition will undoubtedly be granted, as it will prove of great convenience in more frequent and much cheaper transport between those two important points.

THEODOR MEETZ of Alameda, who contemplates changing his horse-car line to an electric road, will wait to see how the storage battery motors on the Oakland Eighth-street road work before deciding upon the method of electric propulsion which he will adopt.

LATE DEVELOPMENTS in electro-photography indicate that it may be possible to take photographs of views located many miles from the camera.

GOOD HEALTH.

More About the Leucanthemum.

We have received the following note from a prominent medical writer in New York in regard to the use of leucanthemum for sour stomach:

EDITORS PRESS.—I wonder that Geo. F. Waters did not tell your readers that the famous cure for sour stomach, the leucanthemum, was only the common oxeye daisy found almost everywhere. It would have saved them the trouble of writing to him. He might have added that chewing a bit of a soft pine stick will give the same result. It is the chewing and swallowing of saliva, an alkaline secretion, which counteracts or neutralizes the excessive acid of the stomach, that does the good.

M. L. H.

WHY IS IT BETTER TO BATHE JUST BEFORE GOING TO BED.—Cold water is a narcotic, as alcohol is, says Dr. Robert Walter, in "Laws of Health." It deadens the sensibilities of the skin, and hence prevents the sensation of cold. It relieves the disposition to chilliness because of this deadened sensibility, and as colds and catarrhs are due to hyper-sensitiveness of the skin, we readily see that the cold morning bath prevents the cold by reducing the sensitiveness; but the cold morning bath does something more. It arouses nervous activity by calling upon the vital system for increased animal heat. The contraction of the vessels due to the cold is followed by a relaxation of them, explained by the principle of reaction, and so through the cold both action and reaction are established, which frequently give delusive excitement to the victim. The tepid or warm morning bath is a great improvement over the cold water bath, but even these are not to be commended. Whoever would enjoy the best of health should take his bath two, three or four times a week, and retire to bed for a rest, thereby allowing nature to secure the best equilibrium of her force and promote the best conditions of health. But no bath should be taken while the patient is weary from labor or excitement. Rest is then indicated. The bath should never be taken on a full stomach nor immediately before a meal, as further power is needed for other purposes under such circumstances.

MEDICAL TRAINING FOR BUSINESS.—A correspondent of the *Medical Age* says: "I have endeavored to keep track of one hundred of my medical friends after graduation, especially of what they did during the first five years, and find nearly 75 per cent had to resort to other employment to make a living. Twenty-three received a salary either in addition to practice or separate therefrom. Fifteen were proprietors of drug stores. Three were insurance agents. Four loaned money. One sold real estate. Three were connected with medical journals. One was an agent for drugs. One was an agent for books. One preached. One was in the patent-medicine business. Two were farmers. One was a manufacturer. Two gave massage treatment. One sawed wood and subsequently suicided. Twelve gave up in disgust, and one never tried practice at all. Twenty-nine graduates only in one hundred exclusively devoted themselves to medicine, and of these eleven associated themselves with other practitioners, and in many cases fell heir to their practice."

GOOD EYESIGHT OF INDIANS.—Dr. L. Webster Fox is of opinion that savage races possess the perception of color to a greater degree than do civilized races. In a lecture lately delivered before the Franklin Institute, Philadelphia, he stated that he had just concluded an examination of 250 Indian children, of whom 100 were boys. Had he selected 100 white boys from various parts of the United States, he would have found at least five of them color blind; among the Indian boys he did not discover a single case of color blindness. Some years ago he examined 250 Indian boys and found two color blind, a very low percentage when compared with the whites. Among the Indian girls he did not find any. Considering that only two females in every 1000 among whites are color blind, he does not think it surprising that he did not find any examples among the Indian girls.

A NEW METHOD of producing local anesthesia has been tried in Germany, with such complete success that a boy watched, unmoved, while a deep incision several inches long was made in his thigh. The part to be operated upon is rendered insensible by cold, but instead of relying a direct application of the cold-producing agent, is touched by a metallic chamber or tube which is cooled by the evaporation of carbonic acid. The temperature may be regulated by simply turning a tap from that of cold water to one so low as to cauterize. A slight burning is experienced when the tube is first applied, and this is quickly followed by anesthesia, which lasts from one to two minutes and leaves no ill effects. The cold may be used for cauterizing and offers the advantage of producing anesthesia at the same time.

SMOKE A BLESSING.—Smoke is finding its champions in England, notwithstanding the efforts made to prevent its diffusion in the atmosphere. It is claimed that the carbon in the smoke is a powerful deodorizer, and as such is a blessing rather than a nuisance.

USEFUL INFORMATION.

How to Use a Telephone.

A reporter of the St. Louis *Globe-Democrat* spent an hour recently in the operating-room of the St. Louis Telephone Exchange, and an entertaining article was the result. The following extract relates to the use and abuse of the telephone:

There were people who could be heard saying one words because they thought they had not sufficiently prompt service, though they had no reason to do so, and if they had just glanced at the rules hanging up by their instruments, they would have seen that they were very much out of order. That is one thing about the telephone. People feel about as safe in saying cross and bad things over the wire as they do by mail. They say things that they wouldn't begin to say face to face to a lady or to a man who happened to be bigger than they. They also say cross and bad things with such perfect recklessness as would indicate that they have an idea that the wire softens the words and causes them to have less effect on the other's feelings. The feelings of these servants of the public are just as easily hurt, however, as any other's. They cannot see the person who wounds them; they cannot tell who he is unless they have answered so many calls for him that they know his voice; but they know the number of the instrument, and that same voice is not liable to get any better treatment than he deserves on the next call.

Remark has been made about the ignorance of people using the telephone. This is not only applied to occasionals, but to those who use it regularly. Abundant evidence was had of this. One man gets right close up to the instrument and yells what he wants loud enough to be heard a square away. The next one stands away back and does the same thing. Another comes along, gets up close and comes as near whispering as possible. There is one way to talk through a telephone, and only one, and few mistakes would be made by "Central" if all users would become acquainted with that fact. That way is to stand back just a little and talk in an ordinary tone, as if you were speaking to a man a couple of feet away instead of to one three or four miles away, over a wire. Don't yell; don't whisper; simply speak in an ordinary tone and distinctly. The words are carried by electricity, not by the force of your enunciation. The instrument is not to be compared to a deaf man, but, to the opposite, is exceedingly sensitive.

A NATURAL RAZOR STROP.—There are now blooming in St. Augustine 16 plants of the agave Victoria regia species, or what is commonly called the century plant. A towering column rises out of the center plant to the height of 60 feet, but it is often relegated to the rubbish heap as worthless, for the reason that, as a thing of beauty, it has no further charms for the eye. Yet many thousands of the shavvy people of the old world utilize this shaft of the plant. They make use of it as a razor strop. Mr. W. Chambers, auditor of the East Coast Railway Line, has had one in use for many years, and it shows not the slightest defect from use. The strop is made by taking the shaft of the agave and cutting it into lengths of 12 inches. These are split into four or as many "quarters" as possible, allowing to each an efficiency of the pulp or heart of the stalk to present a surface of not less than one inch on which to strop a razor. The heart hardens in time and presents a fine, soft and naturally lubricated surface for stropping a razor. —*Jacksonville Times-Union*.

OLD CABLE CAR ROPES.—A prominent cable car line official in Pittsburgh said recently: "The ropes on cable roads are, as a rule, sold as soon as they are put in. The rope upon which we are traveling was sold several weeks ago. The old ropes are sold for inclines, elevators, etc. They are better for that purpose than if they were new. They have become so thoroughly soaked with oil and tar, and so stretched, that they are seasoned. They will never wear out on inclines or elevators, because there is no strain on them compared with that of a cable road, and they have been tested so that they may be relied on. After they have been in use a short time on the cable roads, and before they show signs of wear, they are replaced by new ones." —*Chicago Jour. Com.*

A VERY PRETTY CONCEIT.—A famous woodsman once boasted that he could find his way through a wilderness and return by the same path. Being tested, he carried with him a slender thread, which should serve as a guide for the return trip. Reaching the end of his journey, he lay down to rest. While he rested came the genius of industry and beathed upon his thread and changed it to two shining ribbons of steel. It was a railroad. Throngs of people whirled past him in luxurious cars, and he read upon the train the mystic legend: "Through Express."

BORROWING MONEY at 10 per cent to put into a business that sets about the same is like cutting off the top of the blanket and sewing it on the bottom to make the blanket longer.

ENGINE ENDURANCE.—Engine 13,993, running between Altoona and Pittsburgh on the Pennsylvania Railroad, has a record of 140,000 miles without any repairs.

Passing Events.

The most important local event to chronicle is the final termination of the "long strike" of the Union molders, and the complete victory of the foundrymen. The strike has lasted some 20 months, and has entailed great loss on both sides. It is now happily at an end, the molders having given up the struggle as hopeless.

A mining Congress is to take place at Denver on the 18th of this month, and a silver Congress at El Paso, Texas, next month. Both these bodies will bring to the attention of Congress the grievances of the mining community of the West.

The accident at the Anaconda mine, Montana, by which nine miners lost their lives, is one of those unfortunate affairs scarcely to be provided against, without a complete change in our system of underground supervision of the men.

The Sacramento supervisors have not yet decided to permit the Iowa Hill miners to clean up their claims, and great pressure is being brought to bear by opposing forces to prevent the permission being given. In the end these methods will bring still further sympathy to the miner's side, for their request is not unreasonable made.

The Alien Act and Mines.

When the Alien Land law was passed, the MINING AND SCIENTIFIC PRESS took the ground that it was an unfortunate thing for the mining industry in the Territories. This position we have maintained and it has been borne out by experience. The law did not apply to States of the Union, so that foreign companies could invest in mining properties; but they are prohibited by this law from doing so in the Territories. It is unfortunately the case that the foreign capitalists are more enterprising than those of our own country in putting up money to purchase and properly develop large properties in distant and scarcely populated regions. As a consequence, the Territories largely depended on English, French and German capital to open their mines and establish mining centers.

Men with valuable mining properties, they were unable to develop, for lack of capital, were compelled, after the passage of this law, to look to their own countrymen for financial aid. They look in vain, for the American prefers generally investments in stocks, where money can be made on fluctuations of stock values, rather than those in mines which can pay in dividends alone.

It is to be regretted that this is so, but it is nevertheless a fact. As a result, mining in the Territories is not so flourishing as it should be. In the call for the Southwest Silver Convention, published in another column, the "Alien Act" is especially cited as one of the reasons why investments are not made in mining properties in the Territories.

Experience thus far has proven to the mining men on this coast that English and French investors are good men to have in any mining camp. They do their work thoroughly, put up first-class plants and develop their properties in the best manner. They do not expect to work a mine out in a year or so and do not work for what is in sight alone. Development work is carried on systematically and hills are promptly paid. The older States where such investments have been made have made more money out of these foreign capitalists than the capitalists have made out of the State in the long run, and it was a great mistake to have incorporated in the Alien Act the clause which prohibits investment of foreign capital in mines in the Territories.

The Anaconda Mine Accident.

At the Anaconda mine, Montana, on Tuesday night, 20 men were on the double-deck cage ascending the shaft to the surface, a few minutes before midnight, to go to supper. The upper deck of the cage was so crowded that all could not hold on, and when between the 300 and 400 levels one fell out and his body was jammed between the floor of the lower cage and the wall plate, turning the cage to an angle and hurling eight men to the bottom, a distance of more than 600 feet, to instant death.

The engineer noticed that something was wrong and promptly stopped the engine, but receiving no signal soon raised it to the surface, when the awful catastrophe became known.

Ten men got off from the upper cage uninjured, but two were lying unconscious on the lower deck, one of whom has since died. The killed were: James O'Donnell, C. N. Evans, John Ritchie, James G. Sullivan, Patrick Mulligan, M. McEver, James Roche, W. M. Martin.

The scene at the bottom of the shaft was frightful. A 20-foot sump below the 1000-foot level, where the bodies fell, held 15 feet of water, which was dyed a blood-red color and filled with arms, limbs and a mass of mutilated humanity, which rendered it difficult to identify the bodies. In fact, of the eight bodies recovered, only one could be recognized.

Only a few days ago, the mines started up after a long suspension, and this is the fourth accident since. The men who escaped cannot account for the accident, but it is said after O'Donnell fell off and was caught between the cage and the shaft, that a guide broke, which caught in the timbers and tipped the lower deck. Most of the men killed were strangers, and only two were married. All the company's mines closed down until after the funeral.

It is stated that Mining Inspector Hogan visited the mine and says he found a piece of guide about four feet long in the camp. The shaft, he says, is one of the best in the camp,

and was not badly damaged, as the cage goes still up and down unimpeded. Hogan thought one man must have fallen off first and was caught between the south wall plate and the lower cage. This caused the cage to dip to an angle which would throw the men out. The breaking of the guide, however, he thinks was due to this jolt.

The Mining Congress.

The Mining Congress, which meets in Denver, Colo., on the 18th, 19th, and 20th inst., will have plenty to occupy its time with the silver question alone, yet many suggestions are being made for action. The mining States are arranging to send full delegations that will work for the welfare of the Western region. Among other things an imposing street parade has been provided for. Each camp or county of each State and Territory will be in line according to numerical strength, and a banner will be awarded to the camp turning out the largest number of men. The smelters and machinery-men will make street displays of floats. The Georgetown Courier says:

However, there is nothing that will prove more absorbing than the drilling contest, to which an open invitation has been extended. Prizes aggregating about \$2500 have been hung up for general competition, and those who enter the list may rest assured that the winner will be the best man in his class. Judges will be selected from practical mining men, who have a complete understanding of the fine points of such a contest.

Each team or man will be allowed 15 minutes, and if a tie results, the judges will decide how the contest will be drifted off. Four-pound hammers and five-eighths steel are prescribed for single-hand drilling, and teams will use eight-pound hammers and seven-eighths steel. Ample room will be provided for contestants, who will be free from all annoyance from the audience during the trial. If the number of entries are so great that all cannot drill together, the committee will reduce the time, so that everyone can witness the entire drilling without having to return the next day. There will be no entrance fee charged to the contest, and entries can be made up to and including November 18th.

The Southwest Silver Convention.

The prospectors, miners, mine and claim owners of New Mexico, Arizona and western Texas will meet at El Paso on December 15th to consider the silver question and the alien act. This will be a mass convention, each camp sending as many delegates as it wishes. Meetings are being held in the various towns and camps to arrange for representation at the convention. It is intended in the end to form a permanent organization.

The miners' grievances on the silver question are well known; those on the alien act are not so generally understood, and the expressions and resolutions of the convention should bring this important matter to the front for discussion and settlement. In another article in this issue the matter is referred to more at length. The call for the convention is self-explanatory of the objects, and is as follows:

To the Prospectors, Miners, Mine and Claim Owners of New Mexico, Arizona and Western Texas.

The depression that exists throughout the southwest is due to the unnatural depreciation of silver and to the evil effects caused by that portion of the alien act that prohibits the investment of foreign capital in mining property in the Territories. The object of the Southwest Silver Convention that is to convene on the 15th day of December, 1891, in El Paso, Texas, is to discuss and take steps to remedy those evils. No other subject but the silver question and the modification of the alien act will be entertained by the convention, and all attempts to prevent the object of this mass meeting of miners by the introduction of questions foreign to the principles for which it was called will be suppressed. The restoration of silver to its normal value of parity with gold, and the obliteration of an unjust discrimination against the miners operating in the Territories, will engage the entire energy and time of the assembled miners of the Southwest.

CHAS. LONGUEMARRE,
Pres. Executive Committee.F. W. EDLESTEN,
Secretary Executive Committee.

COINAGE OF THE MINT.—The coinage of the San Francisco Mint in October was \$1,800,000 in double eagles, \$70,000 in standard dollars and \$200,000 in quarter dollars. The coinage for the first four months of the fiscal year was \$7,580,000, against \$3,100,000 for the same time in 1890.

DELEGATES TO THE MINING CONGRESS.—Governor Markham has chosen as three of the delegates to the Denver Mining Congress, which will assemble November 18-20, ex-Justice Niles Searles, Robert McMurray of North San Juan and W. A. Murray of Shasta county.

The Iron-Molders' Strike Ended.

After persistently holding out the many months since March 3, 1890, the molders who left the San Francisco foundries on that date have given up the strike. When they inaugurated the strike 180 men quit work at the shops, but a good many of these men have since had to leave the city to get work elsewhere. The official announcement of the surrender of Iron-Molders' Union No. 164 was made by its President at the meeting on Monday last, in the following terms:

"In view of the fact that during recent conversations with the proprietors we have learned that they will not reduce wages nor ostracize any of the men or boys who have been engaged in the strike, and will ask no questions as to an applicant for employment being a union man or not, also that no objection would be raised to unionizing the shops if we can do so, we have decided to call a halt. This is done to prevent by all means in our power any further suffering on the part of our men and boys, and to let the public see that we were always anxious to end the warfare if given reasonable assurances that we would not be driven to the wall."

The following are the terms submitted by James Spiers and W. H. Taylor on behalf of the Foundrymen's Association, referred to in the preceding paragraph, and which were accepted by the Molders' Union:

SAN FRANCISCO, Oct. 29, 1891.—The Molders' Union having declared a strike against the shops of the Manufacturers' Association in March, 1890, without consulting with said shops, they have no advice to offer the molders as to the matter of declaring the strike off; but they reaffirm what they have always maintained, namely: That no prejudice exists against the men and boys on account of said strike should the same be declared off.

JAMES SPIERS,
W. H. TAYLOR.

This has been the largest strike ever experienced in this city, and the one which has done the most harm. The foundrymen have been put to great annoyance and expense, and the molders themselves have suffered worse. Among others, two deaths by violence may be attributed to this strike.

A curious feature is that the contest was not commenced on account of a reduction of wages or desire for an increase. The rules of the Molders' Union were very arbitrary in the matter of apprentices and amount of daily work, and no non-union men were allowed where union men worked. This latter point was stubbornly fought, but the molders will have to give it up for the future as well as other contested points.

Men were brought from the East by the foundrymen, and some work was done East. Moreover, many orders went away from here which should have been done at home. The men have done themselves and the employers as much harm as they could, and generally injured the largest branch of manufacturing industry in the State. The shops have plenty of men, as they have had for months, so that the Union had to give up the fight in the end. An immense loss of wages has been the result, and harm has been done all around. It will take the iron industry some time to recover the setback it has received in expenses and loss of contracts, etc. The Core Makers' Union has also declared the strike off. The San Francisco foundries will hereafter be run by their owners instead of by a Union with no investments in the plants. The Manufacturers' Association is to be congratulated for the firm stand it took and the successful fight it carried out.

COAST COAL REDUCED.—The coal mining companies with headquarters at Seattle, Wash., have announced a general reduction in the price of coal. The old prices were—\$6 for screened coal, \$5.25 for average, in carload lots, \$3.50 for nut, and \$2 for screenings. A new schedule has gone into effect as follows—\$5 for screened, \$4.50 for average in carload lots, \$3 for nut and \$1.75 for screenings. The companies affected by the agreement are the Oregon Improvement, Seattle Coal and Iron, Black Diamond and Cedar Mountain and the rates are the retail ones. This reduction, which affects not only the Sound consumers, but those at other points on the coast, is due to several causes, among which are the reduction of wages, brought about by the strike, and the reduction in the price of wood. Another point is that the coal companies are endeavoring to meet competition from Australia,

Cross' Electric Indicator and Overwinding Alarm.

The want which has existed for some apparatus which would, with certainty and accuracy, notify the approach to the surface of cages in shafts, and also notify to the engineer the fact that he is about to overwind, is sought to be supplied by the electric indicator and overwinding alarm.

The electric indicator is worked by a worm wheel on the end of the drum shaft moving a finger around a circular plate in front of the engineer. On the rim of the plate are the marks for the different levels, also two contact pieces actuated by the point of the finger. As the cage nears the surface, the finger completes the electric circuit, ringing a large electric bell placed in any portion of the engine-house where it may be clearly heard by the engineer. As the cage goes down the shaft, the finger lifts a spring and so avoids making contact as it passes the contact piece, and thus the bell is

stopped upon, he will not only be instantly notified of what he is doing, but a record will be left on the dial that such has been done. The instrument is therefore not only a preventive, to a measure, but is also deterrent in its operation. The engineer cannot start his engine the wrong way, for he would be made aware of it before he had thrown his engine into gear, and so have a chance of reversing at once. The battery will last about two years without renewal, and the cost is nominal. The units are taken from the last official report of the Secretary for Mines, Victoria, Australia.

Traffic Association of California.

The Traffic Association of California on Wednesday issued its address to the merchants and producers of the State. It is a plain, terse, matter-of-fact document, appropriate to the occasion, and in full is as follows:

SAN FRANCISCO, Nov. 2, 1891.

To the Merchants, Manufacturers and Producers of California:
The necessary arrangement preliminary to the

market for their products, manufactures and merchandise.

The association does not intend to confine itself to transcontinental traffic alone, but to take within its scope matters pertaining to local, coastwise and transpacific traffic, believing that through its medium the establishment of steamship lines to points hitherto not reached from this city can be encouraged, and an improved service to other points effected.

Having stated briefly the objects and purposes of the association, the committee invite all interested to become members.

Folding Ladder.

William M. Peory of Jackson, Cal., has secured through the MINING AND SCIENTIFIC PRESS Patent Agency of San Francisco, Cal., a patent known as a "folding ladder." The principal use of this invention is that of a fire-escape, and its application is shown in the accompanying cut. The readiness with which it may be folded into a compact form, and stowed into small space, recommends itself for various purposes, where the use of a ladder is required. Two rigid bars or rods of iron form the sides of the ladder, which have end stops, the several rods or bars being connected on each side by an ordinary chain link. The ladder rounds are made of light tubular metal, and the side rods or bars pass freely through the ends of the rounds, being limited by the end stops on the ends of the side bars or rods. The entire ladder is light and strong, and is easily folded into small compass, each section hending at the connecting links. By the movement of the sliding rounds, they avoid interference with each other, and thereby occupy but small space. The ladder may be readily reversed, end for

A. W. CROSS'S ELECTRIC INDICATOR.

not rung until the opposite cage approaches the surface. The contact pieces are clamped on the plate by a set screw, and in the event of the length of rope being altered on the drums, the alteration of the position of the contact pieces corresponding with that rope can be made in 15 seconds. The advantage of the disc over using a coiled tape for working a weight to indicate the position of a cage is that the weather has no effect on it as it has on tape. When a chain is used, it is apt to "ride," and when alterations are required in the length of rope, the adjustment of the tape is a matter of time and experiment. The geared finger is positive in action, and alterations from level to level, so necessary in quartz mining, can be made instantly and with great precision. Where the indicator is used, it is giving entire satisfaction.

The overwinding alarm is worked from the same electrical battery as the indicator, but is quite independent of the indicator, inasmuch as it is worked by the cages themselves. Above the landing place, as many feet as may be decided upon as the safe point to which cages may be raised, are fixed on the center skid two springs, the compression of either by a rising cage completing the electric circuit with the other, and dropping a semaphore arm in the engine-house, at the same ringing an alarm bell, which continues to ring until the arm is replaced by the engineer. In the foot of the semaphore is a dial with a pointer on it. Every time the arm falls, the pointer progresses a figure, so that if an engineer is careless and allows his cages to rise above the point of safety de-

permanent organization of the California Traffic Association, viz.: The appointment by the chairman of the meeting held October 17th of an Executive Committee of 18, having been accomplished, the committee now calls for the enrollment of names of all merchants, manufacturers and producers who wish to lend their support, both moral and financial, to a movement destined to mark an epoch in the commercial history of our State of unprecedented importance.

While making this call, the committee deems it a fitting opportunity to clearly set forth the aims and objects of the California Traffic Association:

For the purpose of gain and contrary to the interest of the people of California, the great railway lines which reach this State have formed a gigantic combination, whose ramifications extend to the roads of an adjacent foreign country. This combination has subsidized the line of steamships by way of Panama, and has made its influence felt on the sailing vessels that carry freight from the Atlantic seaboard to the Pacific by way of Cape Horn.

The rates of freight have been arbitrarily determined, and in endeavoring to secure a readjustment of the same you have had to contend with this powerful combination individually and alone. To you is now offered the opportunity of placing yourselves in a position so that you may stand upon equal ground with this combination when endeavoring to bring about an equitable adjustment of matters vitally affecting our commercial existence.

It is not proposed to use the power which this association will have in a hasty or ill-advised manner; only when all negotiations fail will this association make its full power felt. By concerted action and thorough organization it is realized that much can be accomplished as regards traffic matters, which would be impossible by separate or individual and unorganized efforts. This association is not organized for the purpose of affording any member thereof opportunities for revenging himself for wrongs, real or fancied, received at the hands of any transportation company in the past. It proposes to deal with transportation companies, through its committee and commissioner, on business propositions, by business men, and it hopes by business-like methods to secure such freight rates and transportation facilities as will afford the producer, manufacturer and merchant of California an enlarged

A Neat Savings Plan.

The Nickel-Plated Banks of the People's Home.

A very neat and very effective plan for accumulating a good sum of money by small savings is in vogue with the People's Home Bank, and is described in the S. F. Chronicle. The bank has a large number of small nickel-

plated savings banks, oblong in shape and about half the size of an ordinary cigar box. These banks will each hold \$35 in dimes, and their use is becoming general in this city. To get a bank you simply deposit a dollar with the People's Home cashier and take your bank home, where you drop in an occasional dime and wake up some morning to find you have \$35 of surplus coin on hand. The only way you can get at this is to take the bank to the People's Home, where the key is kept, and there unlock it. The matter of putting the money in the care of the People's Home is optional. Most of the dime-savers do so, and thus lay the foundation for a fortune. It is a very easy and very effective way to save money.

THE California Electric Light Co. of this city has sold for \$1,000,000 its plant, franchise, etc., to the Edison Light and Power Co.

ANOTHER "lost mine" has been rediscovered on the property of Wiley, Conner & Co., near Llano, Texas.

Penry's Fire Escape.

end, and the rounds will slip down to what then becomes the lower ends of the side rods or bars. This advantage is particularly present in the use of the ladder as a fire escape, for which purpose one end is connected by means of chains with any suitable portion of the window casing. When not in use the ladder will lie in small compass within the room, but when required, may be dropped out of the window, remaining fast at the upper end. The free end is provided with a hook of suitable character, this end to be raised by a pole or rod, and the hook caused to engage some point above, as, for example, a higher window-sill or the eaves. In this case the ladder is reversed; but the rounds will slip down the side rods or bars to proper position, or either end of the ladder may be raised from the ground, and the rounds will fall to proper position. These ladders may be seen in this city at the Standard Iron & Wire Works, 763 Mission street, near Fourth.

Mining Companies' Financial Standing.

ROPER'S
Practical Handy Books for Engineers & Firemen

By **STEPHEN ROPER, Engineer.**

The Engineer's Handy Book, containing a full explanation of the Steam Engine Indicator, and its use and advantages to engineers and steam users, with formulae for estimating the power of all classes of Steam Engines. Price.....\$3.50

The Young Engineer's Own Book. Containing an Explanation of the Principles and Theories on which the Steam Engine as a Prime Mover is based. Price.....\$3.00

Questions and Answers for Engineers. This little book contains all the questions that Engineers will be asked when undergoing an examination. Price, \$3.00

Handbook of Modern Steam Fire Engines. The only book of the kind ever published. Price, \$3.50

Catechism on High Pressure, or Non-Condensing Steam Engines. Price.....\$2.00

Care and Management of the Steam Boiler. Price.....\$2.00

Handbook of Land and Marine Engines. Price.....\$3.50

Handbook of the Locomotive. Price.....\$2.50

Use and Abuse of the Steam Boiler. Price.....\$2.00

Instructions and Suggestions for Engineers and Firemen. Price.....\$2.00

These books embrace all branches of Steam Engineering—Stationary, Locomotive, Fire and Marine. Any Engineer who wishes to be well informed in all the duties of his calling should provide himself with a full set.

PROPOSALS FOR TUNNELS

OFFICE OF THE CHIEF ENGINEER OF THE Arrowhead Reservoir Company, San Bernardino, California, October 10, 1891.

SEALED PROPOSALS
Will be received by the undersigned until noon of **TUESDAY, the 15th of December, 1891,** for the construction of three tunnels—one of about 2000 feet in length, the second about 4000 feet in length, and the third about 5000 feet in length, through rock, in accordance with plans and specifications on file in this office.

Proposals must be accompanied by a certified check in the sum of \$2000, to be returned to the unsuccessful bidder. The Company reserves the right to reject any or all proposals.

A. H. KOEBIG,
Chief Engineer The Arrowhead Reservoir Co.

HELENA, MONTANA, Room 28, Merchants' National Bank Building, No. 4 North Main St. SOLE WESTERN AGENTS FOR TYLER WIRE WORKS DOUBLE CRIMPED MINING CLOTHS.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

Assessment Notices.

GRAY EAGLE MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of October, 1891, an assessment, No. 26, of Four (4) Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately to the United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of November, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of December, 1891, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
A. W. BARROWS, Secretary.
Office, Room 11, No. 303 California Street, San Francisco, California.

SEND FOR CIRCULAR. E. P. HEALD, President.
O. S. HALEY, Secretary.

THE ORIENTAL GAS ENGINE

IS THE BEST, because it combines simplicity of construction with power and economy in space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.
It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosion. No licensed engineer at a high salary needed to operate it.
Send for circulars and prices if a good safe engine is what you need.

The Oriental Locomotive is Perfection.
M. A. GRAHAM,
Inventor and Manufacturer,

DECK AND DOCK HOISTS

A SPECIALTY.

STEAM CAPSTANS AND SHIP WINDLASSES.

Double Cylinder, Single Drum,
Improved

FRICTION HOISTING ENGINE

With or Without Adjustable Foot Brake.

This engine is specially adapted for contractors, railroads, quarries, inclines, small shafts, bridge building, docks, warehouse, lighters, barges, coal yards, ice houses, pile driving and general hoisting, where boiler is detached and connected by steam pipe, or compressed air may be used. They have double cylinders, friction drum and two balanced crank wheels, and, if desired, extra, are provided with adjustable hand foot brakes, lined with hard maple blocks. Fixtures are same as with single cylinder engines.

ELECTRICAL ENGINEERING CO.,

— MANUFACTURER OF —

Dynamos and Electric Motors

FOR THE TRANSMISSION AND DISTRIBUTION OF POWER

Manufacturer of and Contractor for the Installation of all Kinds of

ELECTRIC APPARATUS.

The Dynamos and Motors manufactured by this Company develop the highest mechanical efficiency; they require little or no attention, are almost noiseless, and run with an entire absence of sparks at the brushes, rendering the daily trimming of brushes unnecessary.

Electric Power Apparatus for Quartz Mills, Hoisting, Pumping, Drilling, and all Mining Work, where Long Distance Transmission is desired, a Specialty.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as in use on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vibration and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight ribbed surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight ribs also save very fine sulphur and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

HOSKIN'S PATENT BLOW-PIPE AND ASSAY FURNACES.

SHEET IRON PIPE

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.
— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,
ALL SIZES.

For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.

Made in Lengths Desired from 10 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed sheet iron of great tensile strength. The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, PETROLEUM and PETROLEUM, at a Temperature of 300° Fahrenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the action of the earth, rust, etc., and is practically indestructible.

CORRUGATED IRON,

Black, Painted and Galvanized, for Roof and Sides of

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880

September 18, 1883; July 24, 1888;

and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

Price of Improved Belt Frue Vanner, \$825, f. o. b.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS.

Was Awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891.

More than Double the Capacity
With One-Half Less Power and Occupying Less than
One-Half the Space of any other Concentrator.

Built of Best Steel and Wrought Iron.
STRONG AND DURABLE.
Price.....\$575 f. o. b.
See for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. This excess in length of material effectually prevents the edges from cracking, plain edge belts have to stretch about one inch to the foot as they pass around the drums. This continuous stretch cracks the edges. The improved belt obviates that difficulty.

PATENTED
Aug. 19, 1890.

GEO. E. WOODBURY, Man'fr. 213 to 219 First St., San Francisco.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

Electric Mine Locomotives.

In last week's PRESS, illustrations were given from Mr. Spaulding's paper on "Electric Power Transmission in Mining Operations," showing a locomotive for underground work. Another out from the same source is given on this page, showing a 40-horse power electric mining locomotive in use in a Pennsylvania colliery. At that place the power plant consists of a standard Armington & Sims engine of 60-horse power, and a 50-horse power Thomson-Houston generator wound for a current of 220 volts potential and the necessary appliances for its operation. The engine and dynamo-room, at the top of the shaft, are in charge of the engineer and assistant who operate the other mining machinery.

From the dynamo to the foot of the shaft the current is conducted by No. 0 Clark wires, enclosed in gas pipes to protect them from damage. From the bottom of the shaft the wires are carried overhead, about 12 inches outside of the low rail of each track, and are supported from an insulator specially designed for this class of work, the construction of which can be readily seen from the accompanying illustration. Whenever turnouts occur, frogs (shown in the cut) are used, the conductors being sold-

GOULD ELECTRIC PUMP.

ered to show them in the same manner as when used for street railway work.

The locomotive was partly described in last week's PRESS. Pinions on the armature shaft mesh with intermediate gears, connection between these and slotted connecting-rods being made through the ordinary crank-pin and box.

FORTY-HORSE POWER ELECTRIC MINING LOCOMOTIVE.

This arrangement allows for variation in position between the wheels and body of the locomotive which carries the motor; and, as the crank-pins on opposite sides are placed at an angle of 90 degrees, there are no dead points. The brake mechanism, rheostat and reversing-switch may be operated from either end by the hand-wheels shown in the cut. The operator has everything under complete control, and can start or stop the car and reverse its direction without moving from one position.

During a period of 11½ days, the average number of cars delivered at the shaft bottom by the locomotive was 559.5, against 526.95 per day delivered by mule-haulage, much time being consumed by waiting at the shaft bottom for empty cars. Thus far the locomotive has shown it will increase the output to 700 cars per day. To deliver 700 cars per day of ten hours, the time of running the locomotive is 5 hours 30 minutes, leaving 4 hours 30 minutes

for contingencies. The total distance run is 21.28 miles, and the locomotive is reversed 232 times.

The first electric pump of considerable size, which, to the writer's knowledge, has been designed, is shown in the engraving. It is made by the Gould Manufacturing Co. of Seneca Falls, N. Y., and is efficient. The pump, as shown, consists of three vertical cylinders, within which are three single-acting plungers, their cranks being hung from the main shaft at 120° angles, in order to produce the most even application of power. In addition to this class of pumps for general hydraulic work, the Van Depoele type of reciprocating engine is being adapted to a sinking pump, which has, as yet, not been sufficiently tested to warrant further mention here.

ELECTRIC LIGHT wires in this city cannot be longer maintained on housetops.

TELLURIUM.—A dispatch from Redding, Shasta county, says: A rich ore body of tellurium and gold has been discovered in the mine of the Eureka Tellurium Co., at Middle Creek. The vein is about eight feet wide and it was struck at the end of a 40-foot drift from a 700-foot tunnel in the hillside and about 200 feet below the surface. It is supposed to be the same vein which was struck a few years ago when an incline tunnel 125 feet long was sunk in the hillside, but which could not be worked because of its rapidly filling with water. The company has put in the most complete machinery plant to be found in the county.

The miners in the North of France are about to strike. They want the sick and pension funds managed by the Government instead of by the mining companies. They also demand a modification of the system of compulsory cessation of pit work, which was arranged in order to reduce the output.

The San Francisco & San Mateo Railway Company has notified the Supervisors that it has spent \$50,000 in the construction of the railroad, as required by the franchise granted one year since.

By a gas explosion in the Susquehanna coal mine, Nanticoke, Pa., on Sunday, nine men were killed and several others injured.

The Reduction and Extraction Works at Kingston, N. M., will increase their present capacity to 100 tons per day.

It is reported that operations will soon be commenced in the Cherokee mine by the drifting process.

HANGER AND FROGS FOR ELECTRIC MINE LOCOMOTIVE.

What California Mining Needs.

Opportunities for Investment in This State.

The Oroville (Butte Co.) *Register*, of Nov. 5, has an interview with Col. Frank McLaughlin, which is as follows:

When asked his opinion concerning the mining outlook in Butte at the present time, he replied: "I think the outlook is very encouraging. The local press has been hammering away on this subject for some time past and the reviews thereon by the newspapers at large have directed much attention to the mining industry in this section. In fact, I do not know of any county in the State that is receiving more attention than Butte. The extensive river mining works, now under way near Oroville, are also doing their share in calling widespread attention to the unlimited mineral resources of our country, resources that embrace all classes of gold mining. In Plumas and Sierra counties the success of Happy Hollow and Scotch Company at Gibsonville, and many other paying properties, have done a great deal of good for mining investment in those counties, of which I believe Plumas to be the richest in mineral deposits of any in this State."

Drift Mining.

"I think that drift mining will receive a great deal of attention in the future and I believe that money invested in that class of mining will be amply remunerated. In my opinion, the true wealth of the Sierras lies in the old Pliocene rivers, those auriferous storehouses that enriched our present streams, and the rich bars and gulches that so amply rewarded the mining Argonauts. There is a large amount of this class of mining being carried on in this county, particularly at Brown's Ravine in the Gravel Range, and throughout the Dogtown ridge. The present strike on the old Mineral Slide mine is bound to attract capital to that section, which, with the assured reopening of the celebrated Pershaker mine, is a forerunner of the future prosperity and business of Dogtown and the other historical mining camps of that gold-producing region. The river beds, now buried beneath the lava, that in past ages flowed into the canyons of those ancient rivers and there solidified, will be the future treasury of the miners of this county, and one from which they will draw millions. The gold of the big gravel flats, which surround us here, formerly the site of the hydraulic mines of the past prosperous mining era, was undoubtedly derived from those old channels, though the gold contained in the former gravel deposits, having been transmitted from a great distance, and being, therefore, more greatly "washed," is much finer than that now found in the old river channels themselves.

Old River Systems.

"The geology of the Sierras is largely a sealed book to the miner, it is so little understood. The best producing gold mines in California to-day, are drift mines, yet no certain knowledge exists as to the location or trend of the old rivers in which these drift mines are carried on. The striking of them is largely a matter of luck, even with the most experienced drift miners, who, with the assistance of their own practical knowledge, could study to great advantage the articles and papers on the ancient river beds, particularly Whitney's "Auriferous Gravels," and others which have been written by those eminent authorities, W. A. Goodyear, John Hays Hammond, Prof. Le Conte, Prof. Hanks, Ross E. Browne, A. J. Bowie and R. L. Dunn.

As an instance of the advantage of a scientific study of the ancient river systems, we have the case of Mr. Goodyear who correctly located the course of the "Mountain Gate" channel long before the discovery of the "Hidden Treasure," both bonanzas of Placer county; and more extraordinary still, he prognosticated the bend in the channel of the Paragon mine long before the Mayflower discovery, which when opened up, demonstrated that his theory was correct. The English Government greatly assists the miners in Australia and New Zealand by giving them the experience and advice of the most competent experts, by most complete and elaborate geological maps and surveys of the mining regions, exhaustive examination by means of diamond drills, etc., and I believe a proper study of the distribution of the old river systems by our own competent Government authorities and the proper dissemination of such knowledge when acquired would open up vast deposits of gold now unknown to the miner or prospector.

The Great Drawback.

"The greatest drawback that mining has in this State is the lack of encouragement it receives from local capitalists. We badly need capital to assist in developing mining properties. No man can borrow a dollar from the banks or other financial institutions on such security, though money can be borrowed easily on land here of cultivation, or growing wheat, etc., or orange or olive land, even though it be just planted, but not a dollar can be raised on good mining property. The trouble with Californians is that while collectively they all hurrah for mining, individually too many are opposed to it."

"The statesman who can devise a means of State assistance to help the working miner develop our hidden mineral resources will indeed be hailed as a benefactor. There is no more brave or determined band of heroes in the land

than the gold prospectors in our State, or a class more deserving of national or State aid—aid which by helping the individual would at the same time add vastly to the material development of our country.

To Develop Prospects.

Many a bonanza is lying dormant in this State for lack of a few hundred dollars required by its locator to develop it. How many a miner has passed over to the great majority, leaving a location or property practically unopened for want of a little money, and which property has lapsed into the wilderness from which its dead owner lay down his life in privation and lonely sorrow in his brave attempt to wrest it. I tell you no one in a thousand of our people know the gallant fight that is carried on from year's end to year's end, and by the miners and prospectors of this country. Ridicule, doubt, loneliness, want, extremes of heat and cold, and the most fatiguing labor are the lot of many a brave and noble heart that is to-day laying the foundations of wealth for those who will never know, or perhaps care but little if they did know, the story of the struggle that was waged by the prospector. If our Mining Bureau, which, under its present most capable head, Wm. Ireland, Jr., is more in touch with the mining industry of this State than I have yet known that Bureau to be, had the power to send some of its competent mining attaches to investigate a miner's prospect upon his request for such examination, and if in the opinion of such expert there was every indication that a good mine could be developed by the expenditure of a certain sum of money, and the Bureau could then loan such sum to the miner under certain forms and restrictions, I believe the gold output of this State would be more than doubled by the expiration of two years from the inauguration of such State system of assistance. Here is a chance for some Native Son of the Golden West who aspires to political prominence to make his name blessed and honored, a chance to reward the man who made this State, and who are making it what it is to-day, a chance to pay a debt of gratitude, the result of which will open up mines that will restore to the world the gold now lost to it by the unjust and arrogant stoppage of hydraulic mining.

Governor Stanford has promulgated a theory of National assistance for the farmers; who will do the same for the miners? I have known instances where men have spent years, in some cases almost a lifetime, in trying to develop a mine. They would mine for a few months and then be obliged to seek other employment to earn money, then return and spend it for supplies and labor at his mine. Years have been wasted in this way, where with a little capital and machinery the development could have been made in a few months.

Capital Wanted.

"Capital for mining must come largely from the outside. In this State it is mostly held by elderly men, who will only loan money on the most gilt edged security, and mines they do not consider of that class, though as a rule their fortunes were acquired either directly or indirectly from mining. Lacking State or national assistance, relief may be obtained by proper representations of our great mineral resources, which would tend to bring into this State prospectors who cannot carry on their work during the severe winters of Montana, Nevada, Utah, Idaho or Colorado, many of whom would probably have Eastern capital at their back. Such men would have a practically unlimited field for their skill and knowledge, as there are hundreds of square miles in Butte, Plumas and Sierra counties which are to-day untraveled and unprospected, beyond the mere superficial prospecting of the early-day miner, who only searched for \$100 rock or \$20 a day diggings, and so passed by or abandoned as worthless and left to the wilderness mines that to-day would be snapped at if they were located and opened up for the inspection of capital.

Mineral Collections.

"Another thing that Butte county ought to do is to have a first-class collection of her minerals, her gold, platinum, silver, iron, copper, mica, coal, yes and her diamonds, for probably a hundred karats of brilliants have been found unsought in the Cherokee mines, got ready for exhibition at the World's Fair. In making known the richness of our mines, we need something stronger than newspaper description or pamphlet publications to place before capitalists.

In Butte County.

"There are any number of bright, of most promising prospects in quartz which, with private capital, or (if it might be) some State allowance to aid in the development, could be made most valuable mines. Take Forbestown, in this county, for instance. This old camp lay almost dead, certainly sleeping, yet it covered mines of untold wealth, and after many years of untold labor and brave devotion, the life-work of its prospectors has finally brought the attention of capital to its mining possibilities, with the result that extensive mines are now being worked there, thousands of dollars being put into circulation, large mills erected, and the owners thereof receiving big reward from properties that two years ago were begging for a little financial help.

"We have to-day near this town, in what is known as the "Lava Beds," one of the richest mining sections in all California. Fabulous sums were taken from the auriferous gravels there, yet no organized effort has ever been

made to reach the deepest gravels, where the greatest deposit of gold must lay. This needs organization with large capital to erect great pumping works to drain the waters and explore the deeper deposits that must certainly be enormously rich. With the intrinsic value they possess, the day will come when capital will seek our mines, but meanwhile we must do all in our power to court investigation and money for development."

The Drilling Contest at Denver.

The Drill Committee of the Mining Congress at Denver has increased the amount of prizes to be awarded for hand drilling to \$2500. It had been originally intended to make the amount \$1000, but the widespread interest aroused in what promises to be the greatest novelty of the congress induced the committee to raise the figures. For the double-handed drill, therefore, the first prize will be \$600, the second \$400, the third \$300, the fourth \$200, and the fifth \$100. The single drill will range: First prize, \$300, second \$200, third \$150, fourth \$100, and fifth \$50.

Following are the rules governing the drilling contest:

The Drilling Committee shall appoint three judges whose duty it shall be to take charge of the drilling contest, mark on the stones where each man or team shall drill, start and stop the men, and measure the depth of the drill hole, and award the prizes, giving to the man or team drilling the deepest and best hole the first prize, to the man or team drilling the next deepest hole the second prize, and so on, and they shall furnish the winners a certificate which shall entitle them to receive the amount won. The decision of these judges shall be final.

Each county in the State of Colorado shall be entitled to send three teams to the contest, of two men each, also three single-hand men. In the event of there being more than that number in any one county desirous of competing, then it must be decided which shall be admitted by home contests, and the teams or men who shall receive a certificate from that member of the Drilling Committee representing their county shall be entitled to enter the contest.

All entries must be made at least five days prior to the date of contest.

In case of inability of any of the contestants to be present on the day of the contest, others from the same county may be substituted at the discretion of the Drilling Committee. The time for drilling shall be limited to 15 minutes.

All drills used by the double-hand teams shall be of seven-eighths steel, and the hammer shall not exceed eight pounds in weight.

Drills used by the single-hand men shall be of five eighths steel, and the hammer shall not exceed four pounds in weight.

Each team or man shall furnish their own drills and hammers.

All work shall be down holes and in granite blocks provided by the committee.

In case of a tie, the winner shall be decided by drilling again as may be decided by the judges.

Any team or man who shall violate any of the rules or refuse to obey any of the instructions of the judges shall forfeit all right to contest or to receive any of the prizes.

The above rules are subject to change by the Drilling Committee.

Parties desirous of offering special prizes are requested to notify the Drilling Committee.

The Coalinga Oil Fields.

The Fresno *Expositor* of Nov. 6, says: Reports from the Coalinga oil fields show that there is no delay in the work and no lack of enterprise on the part of the present lessees of the land on which the oil has already been struck, and on which the well has been sunk.

It will be remembered that the locators of the claims leased the lands controlled by them to Messrs. Lacey & Rowland, two Los Angeles oil dealers, who have, as a part of their lease, agreed to develop the property and to give a certain portion of the oil developed as a royalty.

These gentlemen, while continuing in part the work already commenced, have been industriously preparing for their grand work of development, which is now about to begin. They have on the ground the entire machinery for sinking a well to the depth of 1800 or 2000 feet. The immense derrick is of heavy timber, and its heavy foundation has been some time in constructing. The power for the work of sinking the well will be furnished from an engine and boiler already set up. The fuel used will be the oil from the four-inch well, which has been sunk to a depth of 300 feet and from which a fair supply of oil is now being pumped.

The oil now being taken from the well is of fine quality and runs fully 15 or 16 per cent better than the oil from the wells in Pennsylvania.

The work of sinking the great 14-inch well will take considerable time and a large amount of money, but there is no thought of giving over the undertaking until it is at least that far down, unless, of course, the work is stopped by the excessive flow of oil.

There are plenty of prospectors in the region looking for locations, and at present it looks as though considerable money will be invested in that section soon.

Southern California Oil Fields.

In addition to the many other products of the southern portion of the State, oil is no insignificant part, as the following facts and figures, furnished the Riverside *Press* by a friend interested in the Newhall district, will demonstrate.

The Newhall oil district is situated 30 miles northwest of Los Angeles, on the main line of the Southern Pacific railroad. The main oil belt extends for about eight miles through the San Fernando mountains in a southeasterly and northwesterly direction, the formation being entirely of sandstone and oil-bearing shales.

Developments were begun here in 1876 by the California Star Oil Company, at a point seven miles west of Newhall station, and developments have been continued ever since the company merged into what is now known as the Pacific Coast Oil Company.

Developments have recently been commenced on the east side of Newhall, in what is known as the Ellemere district. The remarkable depths of the oil-producing sand have not been exceeded anywhere, ranging in thickness 350 to 755 feet. The first wells bored 15 years ago still yield large quantities of oil with no signs of falling.

At Pico canyon there is a strip of land 840 feet wide and 3800 feet long that has yielded more than a million and a half barrels of oil, and still produces without any appearance of giving out.

The oil of this district is a fine illuminating oil about 41° gravity, being little, if any, inferior to the Pennsylvania product. It is shipped to San Francisco in tank cars, and refined at Alameda Point, eight miles from San Francisco. About a train per day is shipped at the present time, which will soon be largely increased, as a number of new wells are being drilled.

There is one well among this group that has yielded more than \$300,000 worth of oil. Similar indications of rich oil-bearing sand have been traced all through the eight miles of this oil belt by geologists and expert oil miners.

There are a large number of oil indications in Southern California, but few that possess the remarkable indications that are to be found in the Newhall district. At present the developments being made in the Ellemere district, two and a half miles east of Newhall, indicate that the oil sand can be reached at a depth ranging from 280 to 450 feet, and that oil can be produced in paying quantities at that depth.

The average cost of boring an oil well at present ranges from \$4000 to \$6000. As the demand for oil for fuel purposes in Southern California is practically unlimited, it warrants the conclusion that it is a good investment to develop these lands.

There are now 50 wells, with a daily aggregate production of 900 barrels, which amount is steadily increasing. The high percentage of illuminating oil obtained from this crude petroleum warrants the belief that an illuminating oil of a superior quality can be obtained from this oil sand at almost any point within the limits of the oil belt.

The present income of the Pacific Coast Oil Company from the Newhall wells is \$2000 per day, or \$60,000 per month. The running expenses are \$10,000 per month, leaving quite a handsome sum as profit, to be divided up among the stockholders. It beats orange growing a trifle.

THE BLUE LEAD.—W. W. Will, who is a son of Mrs. Bishop, of Bangor, on whose place the blue lead was discovered some months ago, returned from there last night, says Friday's Oroville *Mercury*. He has built an arrastra on his mother's mine, and they are now grinding that peculiar formation. Sufficient prospecting has been done to guarantee good returns. For instance, 70 buckets of the dirt that was hauled from the shaft was run through the usual sluice-box. Then two of those hoses, each 16 feet long, were cleaned up, and the result was \$16 35, and the dirt was not crushed before it was washed. The lead is hard and slaty in appearance and must be crushed. Simply running it through the sluice will not get the gold. The gravel runs all along from 10 to 50 cents a pan. Mr. Will says four companies are engaged in sinking shafts. One is composed of Marysville men, Messrs. Streeter and Bonlaw of Biggs, Dr. Allan and the Bishop mine. Excitement is running pretty high and there is no prognosticating what will be developed there. That the gravel, if such it may be called, is very rich is established beyond question. There is a sample left at the *Mercury* office by Mr. Will that shows several fine speckles on the surface.

ALASKA'S MINERAL WEALTH.—J. C. Green, who is largely interested in mining property in Alaska, has just returned from the north and is now in San Francisco. He says: "The mining outlook in Alaska is improving year after year. The whole country is simply teeming with rich mineral fields, and I am convinced that the day will come when Alaska as a producer of gold and silver will surpass the world. Ranges are being located rapidly, and I know one man who has from 25 to 30 rich claims, which, when developed, will make him, in my opinion, one of the richest men in the world. The industry is yet in its infancy, and capital will be required to develop the lodes, but when the boom once begins it will knock the '49 days of California cold."

An Unjust Decision.

Mines or Railroad Grants.

The following is from the *Battle* (Mont.) *Ey-Stander*:

The writer has examined most of the decisions of the courts hearing on the question as to what are mineral lands in the several Acts granting lands to railroad companies, but reserving therefrom such lands as are mineral. In them there is evidently a settled purpose to give to railroad companies to which Congress granted public lands all lands within their grants except those known to be mineral at the time of the definite location of the lines of the several roads. There is a possibility that where lands which cannot be identified because they are not surveyed and on which mineral has been found before survey, may escape this legal drag-net that has been set to catch nearly all the mineral lands on odd sections within the limits of the grant to the Northern Pacific and other roads. The question must be settled in the Supreme Court of the United States, which has already intimated, in a case which went up from this city, that its decision would be in favor of the land-grant railroad companies. There is only one decision unfavorable to the railroad companies, and that is Judge Knowles' opinion in the *Barden* case, where Sawyer and Knowles disagreed. As Sawyer was a circuit judge, his opinion in favor of the road prevailed, but it has been taken to the Supreme Court by and will remain under the control of Major Martin Maginnis, Mineral Land Commissioner of this State.

Within the last week Judge Caldwell, who, we understand, is United States District Judge for North Dakota, at Fargo, in rendering a decision as to the liability of the Northern Pacific Company for taxes, seems to have gone out of his way to reiterate Judge Sawyer's opinion, and even to have gone beyond it, giving the Northern Pacific Company all the mineral lands within the grant and all the mineral within their depths.

That our readers may know how monstrously unjust this opinion is, we recall the facts.

Congress in 1866, in making a grant of the odd sections of land to the Northern Pacific Co., within certain distances each side of its line, excepted the mineral lands. In the same section, out of abundance of caution, it excluded all mineral lands from the grant, and in lieu of such mineral lands so excluded, extended the limits of the grant on each side ten miles farther. At the next session of the same Congress a joint resolution was passed, reserving all mineral lands from grants of lands which had been made to railroad companies at the previous session. These laws make it plain that it was the intention of Congress to reserve from grants of lands to railroad companies all mineral lands—that is, all lands containing minerals. Thus the plain, evident meaning of the laws making grants of lands to railroads was to give them all lands not mineral, classing iron and coal lands as non mineral.

The arguments for and against the claim of the railroad to the mineral lands within their grants are too long to be more than referred to here. To state them fully would take several numbers of the *Ey-Stander* if the space was wholly devoted to that purpose. We shall give them as briefly as possible.

On behalf of the railroads, it is claimed that grants to the companies were *in present*—that is, conveying present title, and that as soon as the line was located and the land was surveyed, the title to the lands granted passed from the United States to the company, and that if the United States did not know there was any of the land mineral, it could not afterward set up the fact that mineral was found upon it, and take it from the company to whom the title had passed; that Congress could not have meant that these lands might be trespassed upon 10, or 100, or 1000 years afterward, and if mineral was found thereon deprive the company or its grantees of title thereto.

The argument on behalf of the Government is that the law granted only lands not mineral, that as all mineral lands were reserved, they could not pass with the grant, and therefore they belonged to the United States. The law puts the burden of proof on the railroad companies, and as they cannot take any mineral land, they must show there is no mineral land on the odd sections before such title passes. The title passes to all lands not mineral, but unless they show a given piece of land is not mineral, they cannot take it.

As to the mineral character of the land, it is claimed by the Government that if any mineral is found upon any odd section, that is proof that it was mineral at the time the grant attached, and that said land was exempt from any effect of the grant, and cannot pass to the company.

The claim of the Government is further strengthened by the rules constraining grants, which is settled by hundreds of decisions, that they shall be strictly construed against the grantees, and that such a construction of the law will not permit the railroad companies to acquire title to any mineral lands.

Then the fact that Congress set apart so large a body of lands which could be taken in lieu of the lands found to be mineral, is urged as a convincing proof that Congress did not intend that any mineral lands should pass to the railroads under the grant.

It also further shows that previous to the passage of the act granting lands to the North-

ern Pacific road, the mountainous lands were known to contain mineral. Thaddeus Stevens said the line would probably pass through the richest mineral region of the country. The congressmen did not know just where the mineral was, but they were assured it would be found all over the mountainous region through which the line would pass. Believing this, it could not have been possible that Congress in reserving mineral lands from this grant, and providing that other lands might be taken in lieu of mineral lands, whose title could not pass to the company, could have meant that any mineral lands should be conveyed because the mineral in it had not been found.

For our part, we do not believe that the grant conveyed present title; therefore it was not "in present," although the supreme court has so said. If this point was argued it would be seen that such a decision is at variance with previous decisions announced by this court. The fact that it even made such a decision shows the influence which railroads have in that court. And if the power of these roads has reached this tribunal, so as to influence its decisions, it shows the great necessity of putting the law making, executive and judicial departments of both State and federal governments in the control of the people. Workingmen must rule this country if they are not to be robbed and enslaved forever by unjust and wicked laws and unwarranted decisions of courts.

Use of Water for Milling.

The R. C. quartz mine and mill is located nearly half of one mile to the east of Brownville, in Yuba county, and is owned by Reuben Clark, a wealthy Colusa county farmer. The mine has been thoroughly prospected, the work extending over a period of several years under the supervision of J. C. Campbell, a practical miner and mineralogist, who during the past summer erected a first-class eight-stamp quartz mill. A large amount of quartz had been raised to the surface and was prepared for crushing as soon as the mill was finished to receive it, and the superintendent expected to have extracted a considerable amount of gold prior to this time.

The power used to run the machinery of the mill is a Pelton water-wheel, which is set about 300 feet below the mill and connected by a wire rope extending from the wheel to the mill. To run the wheel, water was taken from Dry creek, which, after being used, was again turned into the creek with little if any loss. When Supt. Campbell commenced using the water, an injunction was served on him restraining the owner of the mine from taking and using the water, which was claimed by John Knmle and John Barges, who in connection with the South Feather Water and Mining Co. had located and claimed it under the laws of the State to be sold for irrigation and other purposes.

When the case was brought before Judge Davis some time ago, the Court required plaintiffs to give a bond in the sum of \$3000 before he would continue the injunction in force, as it was evident that damage might result from compelling the mill of defendant to remain idle. During the past week or ten days, Knmle and Barges retired from the case, which left the South Feather Water and Mining Co. alone in the contest to perpetually enjoin Clark from using the water.

During Saturday and yesterday the case was up before Judge Davis on a motion by Clark to have the injunction dissolved, which if granted will allow the water to be taken to run the mill without being obliged to pay the water company for it. The case was submitted last evening after a long and tedious argument by counsel, when it was taken under consideration by Judge Davis, who announced that he would render a decision to-day at 2 o'clock p. m. As this is written prior to the time fixed for determining the result, the *Democrat* cannot definitely say what the ruling of the Court will be, but on the principle that has heretofore governed such cases, and the rule laid down relative to the use of public waters and timber for mining purposes, the injunction should be dissolved. If the water was taken and used to the exclusion of others, and damage occur from such exclusive use, the case would occupy a different position; but in this instance no damage is done except to the claimants of the water in the amount of compensation to be derived for its use. At 2 o'clock Judge Davis read his decision, which was quite lengthy, sustaining the motion to dissolve the injunction. —*Marysville Democrat*.

TEXAS ALIEN LAND ACT.—Judge Goodrich, of the District Court of McLennan county, Texas, has rendered a decision in the case of the State of Texas vs. Mallinson, in which he has held the alien land law unconstitutional, on the ground of defects in the caption, which, among other things, refers to individuals without mentioning corporations, while the law inhibits corporations, any stockholders or shareholders of which are foreigners, from holding land. The judge said that the faultiness of the caption was enough to nullify the Act, but added that he regarded the Act as wholly opposed to the Federal Constitution, as it set at naught existing treaties with foreign nations, and its effect upon property rights existing and charters granted by the State in years past was disastrous in its retroactive effect. The case will be appealed.

Southern California Mines.

The San Diego *Union* of Nov. 5th says: A large number of people, it seems, have gone out to the camp at Dos Cabezas, where Burnett & Higgins claim to have discovered silver ore. No further knowledge than this can be obtained until some responsible person arrives from the camp.

James H. Crossman has succeeded in organizing a company to operate mines in the Gavilan district, which is a portion of the San Jacinto estate. A regular network of quartz and feldspar veins traverse the crystalline rocks of that section, and from one of these, the Gavilan, many thousands of dollars have been taken. Prospects have also been found in other veins, and Mr. Crossman and his company may make large fortunes from the mines. The property is leased from the San Jacinto estate (limited), the London corporation operating the tin mines.

A strike of rich gold rock has been made at Menifee, near Perris, by S. E. Walker, in digging a well at his place. The quartz seam was uncovered, it is reported, at a depth of two feet, where it was two inches wide, but containing a large amount of gold. The prospect will be developed.

The Helvetia mill at Julian is crushing quartz rock from the rich bonanza recently opened in that mine.

The boom in Julian has not "let up" a particle, but the encouragement is as great or greater than ever. During the winter the miners calculate to prosecute the development of their claims, and next spring the district promises to be one of the liveliest gold camps on the coast.

The Warlock is as busy as ever. The rich shoot is still in the face, and its known extent is being enlarged every day.

The Cincinnati Bell is also still in bonanza. The *Sentinel* says a project is on foot to run a crosscut tunnel to tap the system of ledges in the hill on which the Kentock S. Cincinnati Bell and several other prominent mines are located.

The Ready Relief, it is understood, is opening another of those great "rolls" of rich rock which have made that mine famous.

Oil Developments.

An oil-boring apparatus, patterned after those in use in Pennsylvania, formed part of the cargo of the steamer Newport, which sailed last week for Shelter Cove. Upon its arrival at that port the machinery will be transported to a point on the east branch of the south fork of the Eel river, in Southern Humboldt county, where petroleum of the finest quality has been found to exist in great quantity.

About the first of the present year a number of prominent Eureka capitalists formed a corporation known as the Humboldt Oil Land Co., with a capital stock of \$1,000,000, which was all subscribed for. Immediate steps were taken to develop the oil region of Southern Humboldt county. Several experts were brought out from Pennsylvania, and they were unanimous in their opinion regarding the superior quality of the petroleum which was found seeping into the creeks and rivers of the district. With the limited apparatus possessed, several oil "flows" were struck which gave promising results. A. W. Gillilan, a Pennsylvania oil expert, was appointed General Supt. of the company's operations. He at once advised getting machinery which had been tested and proved successful in Eastern oil regions.

Although oil has been known to exist in Humboldt county for 26 years, since the first discoveries were made on the Lower Mattole no effort was made to develop it until the organization of the present company was effected.

Mr. Gillilan, who is in this city, states that the company will soon begin the erection of a refinery at Shelter Cove, to which point the oil will be piped from the wells, a distance of 23 miles. It is probable that by next May the company will have so far advanced with the operations as to be able to put its refined product on the market.

LOW GRADE ORE.—A mine to be a good "company mine" should be a large one and worked on a large scale, writes Albert Williams in the *Engineering Magazine*. Thus to be a promising purchase for a proposed corporation, a mine ought to be one which can be worked by a considerable force to insure steadiness of output. A rich but narrow vein where only a limited number of men have room for stopping may be the best for individual ownership, since running expenses are low, and it is not so good for a company as a large deposit of lower grade, capable of being extensively opened and presenting large breasts in the stopes, with a more regular output. The most reliable gold mines have been of very low grade, but with large and regular deposits. In California \$15 a ton is considered a very fair basis for a company-mine if the ore is in quantity; but a very much lower tenor has been worked with great profit in the exceptionally large deposits of the Black Hills and Alaska, where \$5 a ton would leave a liberal margin for dividends. In fact most of the famous mines have not been of high grade, the gold ore rarely showing any metal to the eye, so that most mines have a prejudice against what are called "specimen mines." The same holds to a less extent with the silver

and ore mines. On the Comstock, the heart of "the big bonanza," the greatest ore body ever known, averaged only \$80 per ton including the rich streaks, and that was thought to be very high. The great silver mines of Montana have not averaged anything like as much. There have been exceptions, notably in Arizona, Colorado and Utah, where high-grade ores in comparatively small amounts have produced largely; but, speaking generally, the celebrated mines have not been of that class.

Amador's Resources.

We believe that Amador county has more natural inducements to offer parties seeking homes, and capitalists who wish to wisely invest their money, than any other section of the State. And that she does not now rank among the wealthiest is owing to the fact that the real merits have not been known to men of capital and enterprise. It is now an established fact that our gold mines are among the richest and most extensive on the coast, yet but few of them are developed. Hundreds of mines are lying untouched, which are as rich as well located for profitable workings as the Key-stone, Kennedy, Zille, and other well-known mines which are noted for their output of gold bullion. Many of these undeveloped mines have been sufficiently prospected to show beyond a doubt that they are safe properties for capital to invest in. But for some reason they remain in hands that either have not the means to work them on an extensive scale, or have not the pluck and enterprise to do so.

The county also has an almost inexhaustible supply of some of the best building stone known to mechanism, including the red sandstone, lava, cement stone, and marble equal to any in the world. And strange to say, these deposits of wealth are almost totally unknown to capitalists even of our own State. We also have deposits of coal and lime that in other sections would be regarded as pockets of wealth to those who own them. But here they lie unappreciated, awaiting the day when more enterprising men will step in and make fortunes where poverty prevails for want of exertion and business push. We also have soil and climate for the raising of grapes, fruits and vegetables that can be surpassed by but few spots on the face of the earth. Then why is it that Amador county is comparatively unknown and undeveloped? We answer simply because there is lack of enterprise and business activity on the part of our people. We need a little of the leavening qualities of boomism among our inhabitants. —*Amador Dispatch*.

MINING AT AUSTIN.—Austin *Advocate*: The Austin Mining Co. has put on about 12 additional men. A. Hennessey, Joseph Polkinghorn and P. H. Miles are the shift bosses and C. O. Engstrom and Adam Giersen the machinists. Two six-horse teams are hauling wood from Clifton to the Patriot, and the work of pumping the water from the Patriot is progressing favorably. General Manager Farnsworth and his assistant, James Earles, with the book-keeper, Mr. Cox, are constantly busy putting the affairs of the company in running order. We understand that James Earles will remain in Austin as foreman for Mr. Farnsworth, and also Mr. Cox as book-keeper, and from the reputation of these gentlemen we have great hopes of much substantial prospecting and developing being done that must, of necessity, largely benefit our town and county. Our people have grown poor during the years of inactivity of the Manhattan Co., and now hail the Austin Mining Co., and will aid and encourage it in every legitimate way to success. Its interests are our interests; its success or failures must be our success or failures. We therefore hope that in due course of time the Austin mines may be made to produce bullion as in the days gone by, and that the owners will be rewarded for their investments, and the homes of our citizens re-established and our people be made to feel that there is a chance to live and succeed in the town to which so many have become so devotedly attached.

A GOLD EXCITEMENT.—*Central Nevada*: Near the old Unionville road, between Pleasant Valley and Unionville, at the head of Chinabur canyon, six miles west of Joe Miller's ranch and 65 miles southwest of Battle Mountain by way of Jerney, is the location of a local gold excitement. Three months ago the ledges were discovered by a man named Kennedy, a prospector. For a month he worked quietly along, at odd times making trips to Winnemucca to test his samples. The ranchers near by learned of his find, since when they have all turned out with pick and shovel to dig holes and make locations. The mines are so far removed from the railroad that but meager information has been obtained. The quartz taken from a nine-foot vein by Kennedy ranges from \$10 to \$200 in gold, and carries some silver. He has sunk 60 feet on the vein and taken out 40 tons of ore. In addition to the locations made by Kennedy, Mark Wiggins and Ed Stone have a location, ore assaying as high as \$148 in gold; Warren Hillyer, 3 claims; Jake Leick, 1 claim; S. Kell, 7 claims; besides locations by others. William Ford, F. Ingstrom and others from Austin have visited the mines. The ore is free-milling, and an arrastra is being constructed to reduce the ore. Thirty miners are now in the district.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

WHITE MINE.—Amador Ledger, Nov. 7: The crushing of the rock from the White mine, north of Jackson, at the Amador mill did not pan out very encouragingly. Work at the Bright claim near Jackson was brought to a standstill last week. The American Flat gravel claim at Oleta bids fair to prove a good paying property to those who are now undertaking its development. An incline tunnel has been run to tap the gravel bed, which is said to be several hundred feet wide and three to five feet thick. Gravel has been taken out lately which yields all the way from 50 cents to \$7.50 to the pan. They are putting up machinery to haul the gravel up the incline, which is said to be a much more satisfactory way than to hoist out of a perpendicular shaft. The chlorination works at the Clinton Consolidated were started last week, with a gentleman named Olive from Grass Valley—an experienced man in the treatment of sulphurets—in charge. The hoisting works are not yet in running order, on account of delay in getting the necessary timbers. Both mills are running on ore from the Clinton Consolidated. The sinking of the shaft is being pushed as fast as possible, and will proceed much faster when the new hoisting works get to work, which will be in the course of two or three weeks. The New York mill started last Tuesday and is working remarkably well. Mr. Doane, formerly of Plymouth, is in charge. An electric-light plant will be put in at the Zeile in the near future. The compressed air machinery at the Keystone is not working very satisfactory. It will require time to bring it to the required standard.

SUTTER CREEK.—The mines are still gradually improving. At the Hector they are actively engaged in timbering the shaft, having commenced at the top, and are now down about 50 feet. They have been unable so far to see the water, and are uncertain as to the level they will find it, and there is a possibility that the pumping in the Wildman mine may effect it so that they will have no water to contend with until they reach the bottom levels. The Belmont mill is hung up temporarily on account of the pipe giving out. They are going to replace it with a new 11-inch pipe. There is 315 feet to be made, and an application for bids has been sent to Knight & Co. and C. O. Michell, and the work of making it will be commenced in a few days. All necessary preparations are through at the Lincoln for a winter's run, and they expect to make it pay for some time. At the South Eureka everything is still looking encouraging. The ground is full of little stringers of quartz, and a little gold is found. Progress at the Wildman mine will be reported next week.

Butte.

THE PALO ALTO.—Oroville Mercury, Nov. 6: The Palo Alto mine is now running with ten more new stamps, making it a full-fledged 20-stamp mill. From indications, it is one of the great mines of California. E. McGrath stayed with it for years before he could get a mill up, and when that glad event took place he had rock enough on the dump to run a long time. The first year the ten stamps have turned out many handsome bricks of the "needful," and developments showed that there was room for ten more stamps. They were put in during the past few months, and Mercury is glad to report that the rock gets better and is now averaging about \$7 a ton. The rock seems to be inexhaustable and the owners of the mine are jubilant.

OREGON CITY MINES.—Oroville Mercury, Nov. 6: The Standard G. M. Co. is doing a great deal of work in the mines at Oregon City, on the Feather river, just above Oroville. In early days, the quartz ledges there were famous, and many rich hauls were made. But when the rock did not yield more than \$10 a ton, the mines were abandoned. However, many experienced miners stayed with them, and during the past year, several of the old claims have been bonded to the above named company. Several capitalists below and several well-known mining men of Butte comprise the company, and a good deal of work has been done during the past summer. At the old Bloomingdale mine, one of the several bonded, they have a shaft about 120 feet deep, and are now ready to commence pumping out the 70 feet of water that has accumulated. Their pumps are in position, and work will be commenced next week. Thos. Graner, a well-known mining capitalist, who is an owner in the Palo Alto, is superintending for this company, and he is satisfied that the rock will average \$10 a ton. If so, with the improved machinery now used, the mine is a bonanza. The past several months have been, and the coming winter will be, devoted to development work, and next spring a mill will be erected. The size of the mill will, of course, be governed by the amount and quality of the ore. The miners who have prospected there say that old Oregon City has a bright future under the new order of things.

Humboldt.

HORSESHOE BEND.—Blue Lake Advocate, Nov. 7: The Horseshoe Bend Min. Co. has its sawmill in course of construction at Hawkins Bar, Trinity Co. Mining on Willow creek is about the same as usual. There have been so far no very rich strikes either in quartz or placer. Very little can be done in the line of prospecting this fall, owing to the lateness of the season.

DOWN FORTY FEET.—Mrs. Preston and A. W. Anger passed through Blue Lake, Thursday, en route to Arcata. They had just come from Maple creek and had a spring wagon full of coal from the mine there. They made a short stop at the Advocate office, and we were permitted to inspect a fine specimen taken out at a depth of 40 feet. It was compared with some surface coal of the mine and the superiority of the former was evident. They informed us that they are using coal from the mine for fuel all the time and that it burns well. Operations are going steadily forward at the mine.

Inyo.

PINE MOUNTAIN.—Inyo Index, Nov. 4: S. P. Roberts of Big Pine was in town last week. Mr. Roberts speaks very encouragingly of the mining prospects at Pine Mountain, and predicts that the ledges there will prove rich and permanent. The new mill will soon be producing bullion.

Mono.

THE BODRE CON.—Bodie Miner, Nov. 7: During the past week, east crosscut No. 1, 1700-foot level, was extended 17 feet. East crosscut No. 2, from main north drift, 700-foot level, was extended 13 feet. North drift from top of upraise from south drift No. 2, 700-foot level, was extended 14 feet. South drift 60 feet, the 500-foot level was extended 10 feet. Upraise from south drift, 200-foot level, was extended 13 feet.

THE MONO.—During the past week south drift No. 2, 700-foot level, was extended 13 feet. East crosscut from above south drift was extended 10 feet. There were employed 3 miners and jointly with Bodie, 1 engineer, 1 carpenter, 1 blacksmith, 1 carman, 1 watchman, 1 foreman, and 1 assayer.

Nevada.

MERRIMAC MINE.—Grass Valley Union, Nov. 10: The new incorporation to work the Merrimac quartz mine has found no difficulty in disposing of shares to raise a working capital for that purpose, as 24,000 shares have been sold here at 50 cents per share, and 16,000 more will be taken by S. F. parties. Preparations for work have been commenced under the direction of Charles Stocks, who is to be superintendent of the mine. This mine has been exploited only to a depth of a few hundred feet, is strong and in a good formation. It has long been held in favorable estimate by practical miners.

Plumas.

THE WILDERNESS CO.—Plumas National, Nov. 7: It is with pleasure that we note the formation of another mining company incorporated for the purpose of developing the vast mineral resources of our county. The above-named company is composed of Oakland capitalists—Capt. J. W. Smith, Pres.; C. K. King, Sec'y; Superior Court Judge E. M. Gibson, E. W. Woodward and A. J. McGovern as Directors. The property is located near the Shendoah mine, and several specimens lately assayed by E. W. Harlow gave a result of \$86 per ton of ore. The mines embrace the Seven Pines and Wilderness claims acquired under the mining act of Congress, May 10, 1872, comprises 3000 feet in length and 600 feet in width, situated on both sides of French ravine, in Rich Bar mining district, at an altitude of 2971 feet, being one mile distant from the celebrated Rich Bar, on the east branch of the north fork of Feather river, from which bar, in early days, \$25,000,000 in coarse gold was taken, which gold came from the rich quartz ledges of French ravine. The Seven Pines and Wilderness claims are within 1500 feet of those wonderfully rich mines of the Shendoah Co. and comprise two distinct veins or lodes, each of gold-bearing quartz traceable the entire length. Work already done on the veins shows a face of five feet in width, and is considered by some old miners residing in that district to be the mother lode and the same veins on which the celebrated McGowan mine is situated. The locations were made by Mr. C. K. King of Oakland and Mr. C. H. Mather of Plumas county, and surface explorations have developed ore of a very rich character of free gold quartz. Experienced miners, among whom are Messrs. Bone, Johnson and Jackson of Plumas county, advance the opinion that this property will develop into one of the best paying mines of the State.

San Bernardino.

THE GYPSUM MINE.—South Riverside Bee, Nov. 7: We had the pleasure, in company with J. M. Kelly, of visiting the gypsum mine down in the Santa Ana canyon on Tuesday afternoon. The mine is the property of the Ventura Crystal Plaster Co., and is located in a side canyon about eight or nine miles from Rincon. A good road has been made to the mine and we found about 20 men employed on the work—about 15 in opening up the mine and several others performing other work about the place. A large quantity of gypsum was piled up ready to ship and more was being rapidly quarried out and broken up into convenient sized pieces to handle. A switch is being put in by the Santa Fe Railroad Co. across the Santa Ana river, and the ore will be hauled in wagons to the railroad and taken to San Diego and shipped by boat to San Francisco, there to be made into plaster of Paris. There is a rumor that the Santa Fe Co. will build a switch from their main line across the river and up the canyon to a place near the mine. The gypsum is very pure, and will undoubtedly make a fine article of plaster of Paris. When taken from the mine, it looks like loaf sugar and is hard and brittle like glass.

San Diego.

JULIAN BRIEFS.—Sentinel Nov. 5: Charley Barnett has struck some particularly fine rock in the Hidden Treasure, specimens from that mine exhibited recently surpassing anything in the cabinets around town. Ten tons of that kind of rock would give a man a clear ticket through life. The Sentinel is in hopes that Charley will find plenty of it. The ore now coming from the Cincinnati Belle is very pretty to look at, and the result of the crush is highly pleasing to Superintendent Lane. Twenty-one men are employed by the company at this mine and the Gold King. The Helvetia is working 18 men, and the mill has been busy on rich ore, but is now closed down waiting the arrival of concentrators. There is the same big pay ledge in the face of the drift as has been repeatedly described in these columns, and enough ore is in sight to furnish the men a year's work. L. N. Bailey and son have resumed labor upon the Kentuck S. Smith and Plant are in nearly 100 feet on their new tunnel near the Washington, and will soon cut the ledge they have been driving for. W. O. Havermale has taken a bond upon the Grand Central. Now is the time to work out assessments and dirt is flying from several quarters. There is a possibility that the assessment work on some of the mines now lying idle will uncover good ledges. A few more paying mines would make business hum this winter.

TIN IN THE DESERT.—San Diegoan, Nov. 5: Warner Wheatley returned to-day from his tin mines in the desert. He brought in with him in a buggy about 400 pounds of ore, and says a wagon is following with about 2000 pounds more. An assay is to-day being made of the 400 pounds already ready, and samples of the wagon-load will be sent to San Francisco for reduction. The mines are located 24 miles northeast of Campo in the Laguna mountains. The lead crops out above ground, and is easily traced for a distance of fully two miles. Mr. Wheatley took out nine workmen and left them there to continue prospecting and taking out ore. There is plenty of wood and water on

the ground, and there will be no difficulty in operating the mines. Mr. Wheatley expects some parties here from San Francisco who will take an interest in the development of the mines.

Shasta.

RICHER THAN EVER.—Redding Free Press, Nov. 7: Since the publication last week of the new discovery made in the tunnel of the Eureka tellurium mine, the stockholders have been very much elated by the additional discovery of an abundance of free gold, tellurium and sylvanite ore. In fact, the company has struck it richer than ever. As soon as the strike was made, Secretary Jones looked up the tunnel and telegraphed to Peter Scherer, then in San Francisco, who immediately came home.

THE TELLURIUM MINE.—Democrat, Nov. 1: Much has been written and said about the developments on the Tellurium mine, on Salt creek, that has been prosecuted by Peter Scherer for more than a year past, and the mining fraternity hereabout has watched development on this mine with much interest. In all the vast mining region in this county, it is the only mine of its character yet discovered and being developed. The discovery of the tellurium ore zone on Salt creek at once attracted wide attention, and the mine since named the Tellurium became famous far and near for the chunks of gold and rich sylvanite and gold telluride ore it yielded. But, as is the history of many another good mine, a "horse" came in in slogging the incline shaft on the vein, and many predicted that the mine had, to use a common miner's phrase, "petered." Yesterday we went out to the mine and saw the fruits of Mr. Scherer's pluck, energy and faith. At a point about 650 feet from the mouth of the tunnel, a strong seven or eight foot vein was cut in two. The strike of the vein is east and west, with a dip of 70 to 80 degrees to the south. This ore is the counterpart of that followed down the shaft, carries a large per cent of pyrites and telluride sulphurets assaying an average of about \$68 a ton. Not satisfied with this, Scherer drove the tunnel ahead some 80 feet, and cut two parallel veins with about the same dip, ore from which assays from \$27 to \$60 a ton. He is now drifting west on what we would designate the main vein, and yesterday was taking out rich ore.

Sonoma.

QUICKSILVER.—Healdsburg Enterprise: Mr. Holmes of Knights Valley is engaged in hauling lumber to his place. The lumber he is using in buildings which he is erecting at the Ida Clayton quicksilver mine on his place. Mr. Holmes believes he has a paying vein of ore, and we hope he has.

Sierra.

CLEANUP.—Mt. Messenger, Nov. 7: B. M. Excelsior for last week was 140 ounces of gold (largest since recent discovery of extension of channel) from 900 carloads of gravel.

EXCELSIOR.—Paul Loeffler was over from the north side the first of the week. He and his partners have finished their work at the Excelsior, the rock having got so hard that it was impossible to run the tunnel farther at the price for which it was taken. We have no doubt but that it is a very valuable property. A new contract will be let.

THISTLE.—The Thistle shaft is working about 70 men. A contract for 3000 cords of wood has been let. Three eight-hour shifts are worked in the mine.

Tuolumne.

ATTACHED.—Tuolumne Independent, Nov. 7: The Kanaka quartz mine has been attached for \$485 by Louis Cassaretto, a merchant of Groveland, and Archie Shaw has been placed in charge as keeper. Wm. R. Shaw, the owner, is in Mexico.

THE MARY ELLEN IN ASHES.—Superintendent Cruickshank informs us that the steam quartz mill of the Mary Ellen mine, on the Tuolumne river, near Groveland, was burned to the ground last Thursday night. The mill had been run for day shift only, and at 6 P. M. the fire under the boiler was extinguished. Six men were employed in the mine and mill at the time of the fire. There was no insurance on the property. A water-power mill will probably be built on the old mill site before long. The destroyed mill cost about \$15,000.

NEVADA.

Eureka District.

MEN EMPLOYED.—Eureka Sentinel, Oct. 31: Eureka is dull, but not dead. We do not look for a revival until favorable silver legislation is passed by Congress. It will require silver at par to stimulate production. Capital will take hold when the silver question is settled our way. There is no better mining field on the continent than is presented along the mineral zone from Adams Hill to Secret canyon for the profitable investment of capital. It is the most extensive, as well as the most promising mineral belt in the West to-day. A great many hundreds of claims are located along this belt, many of which carry good prospects at the surface. There are more than 50 mines being worked at the present time in the various subdivisions of Eureka district and Newark and Silverado and Secret canyon and the Diamond range and Spring valley. Outside of the principal mines the forces are small, generally ranging from one or two men to a half dozen. A great deal of the work is being done either by prospectors or tributers. A close estimate, amounting almost to an actual count, places the number of men employed in Eureka and neighboring districts at 250, about one-half of whom are working for day's pay. The rest are for themselves either as prospectors or tributers. Practically, every mine being operated has some sort of showing of ore. It may be only such a quantity as a man can hoist with a windlass or run out of a cut or tunnel with a wheelbarrow in many of the mines, but it demonstrates that we have mineral in more spots and covering a greater area of territory than any other mining district in the whole Western world. We give below an incomplete list of the mines under work with the number of men employed: Diamond, 70; Hamburg, 18; Dunderburg, 7; Eureka Con., 30; Richmond, 20; Williamsburg, 16; Phenix, 8; Jackson, 10; Eureka Tunnel, 1; Pioneer, 2; El Dorado, 2; Connelly, 1; Mortimer, 2; Shindle, 2; Wallace, 2; Silver West, 4; Bullwhacker, 5; Mountain Boy, 3; Geddes, 3; Seventy-six, 2; Diamond Range, 5; Newark, 10; Ruby Hill Tunnel, 3; Silver Connor, 3; Silverado, 9; Page & Corwin, 2; Matamoros, 4; Volk & Piantoni, 2; Lizzie L, 2; Dead Broke, 2; Needie, 2; Dugout, 1; Hugenot, 3; Antelope, 2; Joe Dejour, 5; Eureka Star, 1; Orange, 2; Lord Byron, 7; Reeves & Berry, 2; Silver Lick, 4; Diana,

2; Hagerman, 1; Betti, 1; Oregonian, 2; Margaret, 2; Adelpia, 2; E. H. Rose, 2, and Mount Hope, 2. This is only a partial list, but it will be found substantially correct as far as it goes. There are no doubt several claims that have escaped our notice; but enough have been furnished to show the scope of operations going on in this district. The showing is not what we once had nor what we hope to have again, but it is better than that offered by an utterly stagnant and hopeless camp. Eureka is passing through a severe depression, but it has better prospects of future growth and prosperity than any other town in the State. Our possibilities are without limit when the conditions begin to set in our favor. For the present, however, and possibly for a year to come, the town is too large to be well sustained by the number of producers we have in the field.

Washoe District.

CON. CALIFORNIA AND VIRGINIA.—Enterprise, Nov. 8: There has been extracted from all parts of the mine during the week, 988 1220-2000 tons of ore, which was shipped to the Morgan mill. The average assay value of all the ore worked at that mill during the week (980 tons) was \$24.50 per ton. Bullion shipped to Carson Mint, assay value, about \$30,452.25.

GOULD AND CURRY.—200 level: South drift, which is in old stops, has been extended 17 feet; total, 36 feet; face in quartz showing some value.

BEST AND BELCHER.—1100 level: All work on this level was stopped on October 31st, having been taking out track, pipe, etc., during past week.

OPHIR.—1465 level: Have continued our prospecting work near the point where the upraise from the sill floor of this level connected with the drift run west from the winze 122 feet below the sill floor of the 1300 level. No ore has been extracted during the week.

MEXICAN.—On the 1465-level, at the end of the end of the crosscut run west from the north lateral drift at a point near the south boundary line of the mine, 132 feet in, we have cut out a small station and begun to sink a one-compartment shaft.

CHOLLAR.—No work has been done in the east crosscut on the south line, 1200-foot level, during the past week. The south drift from the incline station, 1500 level, is out 313 feet; face in porphyry. Extracted and sent to mill in the past week 476 tons of ore; average battery assays, \$16.52.

UNION SHAFT.—West drift from shaft, 900 level, has been advanced during the week 30 feet, making a total distance west of shaft 1326 feet; face in clay and porphyry.

EXCHEQUER.—East crosscut from the north lateral drift 150 feet south of north line, 600 level, is out 85 feet; face in clay and porphyry.

ALPHA.—The south drift from winze, 80 feet north of shaft, 550 level, is out 50 feet. The joint southwest drift from Ward shaft, 1800 level, is out 587 feet; face in porphyry.

WARD COMBINATION SHAFT.—The southwest drift, 1800 level, is out from shaft 587 feet; face in porphyry.

POTOSI.—Southwest drift, 360 feet north line, 1230 level, is out 43 feet; face in porphyry. The east crosscut on south line, 1300 level, is out 284 feet; face in porphyry. The north drift from the winze station, 1400 level, is out 183 feet; face in porphyry and streaks of quartz.

BULLION.—South drift from winze station, Potosi 1500 level, is in Bullion ground 10 feet; face in porphyry. The southwest drift from the 1800 level, Ward shaft, is out 587 feet; face in porphyry.

CON. NEW YORK.—The west crosscut (No. 3), 140 feet north of shaft, 650 level, is out 23 feet; face in soft porphyry. The east crosscut, 700 feet north of shaft, 1100 level, is out 34 feet, the whole distance in quartz, some of which yields fair assays.

SILVER HILL.—Northwest drift, 50 level, is out from shaft 340 feet; face in quartz and porphyry. South crosscut, 160 level, is out from winze 780 feet; face in hard porphyry.

Oaccola District.

GOOD CLAIMS.—Cor. White Pine News, Nov. 7: While our district here is well represented by many good, substantial mining men, at the same time we need capital to invest in our mining interests, in order to show to the whole world what we actually have. Three new discoveries on the summit, two miles east of the town of Oaccola, in metallic lime, horizontal form, only eight feet thick, value in silver \$382. Ore from one of said lodes assayed the above, by McVicar of Salt Lake. The other two have not yet been tested, but have a large grass root showing. Then, one or two miles south of Mr. Hampton's hydraulic works, you will find the American Girl, Mammoth and Yellow Jacket, all in lime contact, cut with vertical feeders supplying the contacts with fortunes of the yellow metal. In the latter Hon. John Butterfield and Mrs. Han a Butterfield, M. D., his very excellent wife, both of Boston, have purchased a half-interest in the Yellow Jacket for \$2000, just about one-fifth of the true value of that mine. A. J. Millick is the one who sold the half interest. Mr. Butterfield two or three years ago bought the Union Jack lode, situated only a few hundred feet above the hydraulic works, and no doubt the Union Jack has largely contributed to Mr. Hampton's placer, for there is over 30 feet in width in this mine that will sample well in gold, and, if developed, would, I believe, prove a bonanza.

ARIZONA.

IMPORTANT MINING DEAL.—Globe Silver Belt, Nov. 4: Prof. James Douglas, Miss Douglas and Mr. Ben Williams of Bisbee arrived in Globe on Sunday last, accompanied by Mr. Philip Oates. Messrs. Douglas and Williams' chief object in visiting Globe at this time was for the purpose of examining the Buffalo copper mine, negotiations for the transfer of which to Messrs. Phelps, Dodge & Co. of New York are pending. The party spent the greater part of Monday and Tuesday in an examination of the Buffalo property, and we are informed, were satisfied with it, so far as they were able to estimate its value. Only two points remain to be determined, namely, a test of the ores (which were thoroughly sampled), and the settlement with the lessees of the property. It is well known that the company which Prof. Douglas represents is desirous of securing a foothold in Globe district, and a favorable report from him will determine the action of the company in the matter. In the event of the negotiations being successful, the deal will likely include a number of adjacent claims belonging to

various parties. It is viewed here as the most important mining transaction in the history of Globe district, and great interest is felt for its consummation. The Rescue Silver Mining Company shipped this week five bars of bullion, making the total to date 57 bars. The mill has been shut down for a cleanup and repairs. The Buffalo smelter was blown in this morning for a final run under present management, the lessees, who are reliably reported to have disposed of their lease to the company represented by Prof. James Douglas. The run will be merely a cleanup of ore and coke now on hand, and will probably continue two weeks or longer.

GOLD.—Prescott *Courier*, Nov. 4: One of the placer miners from English gulch came in with six ounces of beautiful gold taken from that gulch. The gold was very coarse, three of the larger pieces being worth \$20 each. The gold was taken with a rocker. Work is progressing on both ends of the Jerome bucket line, only a gap of about two miles between the two advancing ends at present. Wood is being piled all along the line, to be transported to smelters as soon as the line is finished. The Giroux brothers are having a good deal of prospecting done in the Black Hills country. Yager canyon and vicinity is filled with men working for the United Verde Copper Co. John Webb is reported to have struck a rich body of ore in his Black Hills mine. Messrs. Barlow-Massicks and Swan are putting the Lynx creek hydraulic works in shape to start up as soon as water can be had. The reservoir has been enlarged to double its former capacity. There is a strong probability that work of building the great Lynx Creek dam will be commenced in the spring. The roaster at Copper Basin was started up again yesterday, and all available men put to work.

COLORADO.

FROM GOTHIC.—Cor. *Elk Mt. Pilot*, Nov. 5: A change has been made in the Sylvanite management. The mine will be run all winter to its full capacity. The upper workings will be run mostly by leasers. The Virginia mine will be worked all winter with a force of from six to eight men under a working lease. The leasers have already taken out a car of ore, which netted over \$1,000 to the car in ten days work. Lewis Waite and G. H. Judd have started a tunnel in the iron contact, up Copper creek. They have started a tunnel large enough to run it 2,000 feet with room for a doubled track. H. C. Roberts and P. E. Weston have completed the work on the Man-yunk lode, adjoining the Virginia on the south. The boys have a good showing and have the apex of the vein. Jake Goodwin is down from Queen basin and reports his property looking first-class.

DAKOTA.

GOLDEN REWARD CLEANUP.—Deadwood *Pioneer*, Nov. 2: Col. Carpenter brought the cleanup from the G. R. chlorination works, for the last 15 days of October, to the Deadwood bank yesterday for shipment. The gold brick contains \$16,500, and the lead bar \$1500, making \$18,000, or a total of \$34,500 for the month. The output will be increased 50 per cent as soon as the mammoth roaster is started up, which will be in a few days.

IDAHO.

BISMUTH AND NICKEL.—Wood River *Times*, Nov. 4: George Cranston is again in town with samples of nickel, cobalt and bismuth ore from his claims at the head of the East Fork of Fish creek. He has a great width of vein—fully ten feet in one claim, carrying copper, lead, silver, antimony, nickel, cobalt and bismuth; but the metals are so widely disseminated that he has not as yet been able to make the product pay for working. He recently sent ten pounds of bismuth to St. Louis, for which he received \$2.50 per pound. This was, however, obtained by panning a large quantity, probably all of two tons, which was a very laborious and tedious job, and scarcely paid for his work at the rate of \$1 per day.

DE LAMAR.—*Nugget*, Nov. 2: The DeLamar Co. platted the ground and made measurements preparatory to having the grading done for their mill last week. The mill will be placed in the little gulch just below the present mill, and will be built lengthwise with the gulch with the batteries and pans set in two rows on either side of the center of the building.

ON THE UP-GRADE.—Elmore *Bulletin*, Nov. 7: Rocky Bar is again climbing the grade to prosperity. At the 550-foot level of the great Elmore mine a large body of low-grade ore was encountered several months ago, but it scarcely paid expenses. A winze was then started in the West End drift, the sinking of which was difficult and of slow progress, owing to the vast amount of water encountered. The winze above mentioned was sunk but a few feet before good ore was found, and it was continued down to a depth of 50 feet, the ore body improving in quantity and quality as depth was attained. Evidently the company is satisfied with the developments made in the winze, as the superintendent today advertises for bids to sink the main shaft 200 feet deeper, and also has ordered 40,000 feet of lumber from Casey & Holland's sawmill. Just now the people of this section have good reasons for anticipating booming times by early spring.

MONTANA.

ELECTRICITY FOR PUMPING.—Butte *Inter-Mountain*, Nov. 3: An electrical pump has been ordered from Fraser & Chalmers by the Colorado company, and will be used in forcing the water to supply the new concentrator now being erected. The pump will be placed near the Butte reduction works' dam, and the wires conveying the current will be led from the dynamos at the Colorado concentrator. This will be the first application of electricity to pumping engines in this vicinity, and should it prove as successful as its promoters anticipate its use will be largely adopted by many mills, smelting plants and mines in Butte, which now depend wholly upon steam as a motive power.

REDUCTION WORKS IMPROVEMENTS.—The improvements and additions to the Butte reduction works, which have just been completed, will afford greater facilities for the bandling of the great quantities of ore daily treated at these works. A large elevator has been placed in the smelter to hoist the ore to the Bruckner furnaces, and preparations are being made for the placing in position of another

blast furnace. The concentrator has been extended and two double-decked revolving slime tables have been added to the two already in use. The engine-room has also been enlarged and renovated and four new boilers have been ordered to take the place of those in use at present.

BUTTE NOTES.—*Miner*, Nov. 7: Bullion shipments last week amounted to about \$75,000. The pumps have been set to work on the Morning Star mine on Mercury, east of Montana. For the purpose of making some needed repairs thereto, the Silver Bow mill is now closed down. The shaft of the Pike's Peak mine, south of the city, will be sunk an additional 50 feet, which will make it about 200. Messrs. Grant and Benham are sinking a shaft on the Oncida claim, near the Parrot addition. They have a lease and bond on the property. The scheme for sinking a deep shaft below the city, and driving a long crosscut north to tap the many veins that underlie the city is still underway. The new air compressor at the Alice is about ready for business. The old one, which has rendered good service in the past, will be kept in readiness for use in case of emergency. The Lexington, Alice, Boston and Montana, Butte and Baston, Bluebird, Glengary, Monitron, Colorado, Butte reduction works, Parrot, Anaconda and Bannister companies are all running full blast. A large body of good ore has been encountered in the Manhattan claim, the shaft of which is situated just to the east of Montana street, between Gold and Porphyry. The shaft is now being sunk to the 200-foot level.

AT BUTTE.—*Bystander*, Oct. 31: Monday the first train of ore was shipped from the Anaconda mines over to the smelter, and there have been two trains shipped every day since. The High Ore and the Modoc have begun work, and before the close of the week there will be three or more trains of ore sent to the smelter every day from these mines. It will probably be a week before all of the properties are worked to their full capacity. The Wake-Up-Jim and Buffalo still remain idle. There has been some change in the management of the properties. Mike O'Farrell will be Mr. James Laird's assistant at High Ore, Wake-Up-Jim and Modoc; John Kane will be foreman of the Anaconda, and Mr. Bulger at the St. Lawrence. Already Butte seems like the Butte of yore. There are not so many idle men on the streets, and Main street is crowded with men in the evening as of old. Butte's prosperity depends upon its mines, and there are so many now being worked, and so many leads that have never been explored, that its continued prosperity cannot be doubted. The opening of the Anaconda has awakened the thoughtful men of the city to its opportunities. The town is well laid out on a beautiful slope, it is easily drained, there is water sufficient within reach to furnish a city of half a million of inhabitants, and there is nothing in the way except the smoke to make it desirable for homes as it is now for business.

NEW MEXICO.

LONE MOUNTAIN.—*Southeast Sentinel*, Nov. 3: About four months ago the attention of John Brockman was attracted to the mines of Lone Mountain, and after careful investigation he bonded four claims, the Home Ticket mine, situated about one mile south of the Lone Mountain camp, from Richard Hudson and John Frost; the St. Paul mine, about one-half mile east, owned by Wm. Braun; and the Mayflower and Metal King mines, adjoining claims, on Warren's Flat, from M. W. Neff and Clark Rodgers and W. H. Newcomb. The latter two claims have been purchased. Mr. Brockman has 20 men at work, six of whom are working on the Home Ticket. In this mine the shaft is now 90 feet deep and an 18-inch vein of ore, which returns of shipments show to have a value of \$90 to \$200 a ton, is exposed. The shaft is being rapidly pushed down to the depth of 150 feet, at which drills will be run and the value of the property determined. The ore is shipped to El Paso for treatment.

AT GOLD HILL.—*Western Liberal*, Nov. 6: C. S. Kellum was in from Gold Hill Saturday, and was telling the *Liberal* about the new strike on the Engineer. He has over a hundred feet of ore exposed, ranging in thickness from 4 to 26 inches, which will mill a hundred dollars a ton. Mr. Kellum is hard at work getting the mine in shape to get out the ore, which he intends to have milled as fast as possible. The Engineer, the Reservation and the Good Luck are making a reputation for Gold Hill, and will produce a great deal of bullion the coming winter. The success these properties have made recently has started all the prospectors to hunting again, and in a few weeks all the vacant ground in the camp will be located.

OREGON.

A LITTLE DUBIOUS.—*Bedford Democrat*, Nov. 1: The prospects of the Cyanide Process of Baker County fulfilling their part of the agreement with the Eureka & Excelsior Con. Gold Mining Company are not as encouraging as they might be at this writing, but the company and its manager, Lawrence C. Goodrich, may yet surprise us. The continued absence of Mr. Goodrich in the East and his failure to let contracts for wood, as advertised in the *Democrat*, certainly look bad and tinges of something back of all the blow and bluster made a few weeks ago. Nov. 1st was the date set by Mr. Goodrich for a resumption of operations at Cracker Creek, and as yet no move has been made in that direction. No provision has been made for a wood supply at the mill and the snows of winter are not far off. If Mr. Goodrich intends keeping his promises with the E. & E. Co., as well as with the people of this community, there will have to be something done besides talk.

INTEREST PURCHASED.—It is understood that Mr. Johnson, a representative of Denver capitalists, recently purchased the one-third interest of the late Wm. Hervey in the Silver Crown mine, on Rock creek, for the sum of \$1500. The other two-thirds interests in the mine are controlled by Messrs. Dan Kelly and Sam Folt. The property is said to be developing beyond the most sanguine expectations of the owners, and is a mine that will yet make them independently rich.

WASHINGTON.

OKANOGAN.—*Outlook* Oct. 30: The mining interests in Okanogan county were never in a more healthy condition than at present. During the past season

many new and important discoveries, both in gold and silver, have been made and the year's work, which has about closed, has been altogether satisfactory. With the progress made this year it is reasonable to expect that 1892 will witness still greater activity in the working and development of our rich mines and prospects. There is every assurance that several mills will be built in this vicinity next year and that the railroad will be extended at least 40 miles nearer.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING NOV. 3, 1891.

- 462,468.—SHOE—Geo. Bryant, S. F.
462,623.—FRICTION CLUTCH—H. P. Christie, S. F.
462,475.—SIGHT FOR FIRE-ARMS—F. W. Dobbel, Purissima, Cal.
462,666.—PUMP—H. J. Dykes, Peralta, Cal.
462,636.—PIANO ACTION REGULATOR—W. D. Gibbs, Los Angeles, Cal.
462,434.—FEEDER FOR THRASHER—Chas. Harrison, Davenport, Wash.
462,550.—PUMP MOTOR—C. C. Henderson, Centuria, Wash.
462,555.—SLEEVE HOLDER—H. L. Hoyt, Portland, Or.
462,437.—CONSTRUCTION OF FLOORS OR WALLS—P. H. Jackson, S. F.
462,490.—LEVER-POWER MECHANISM—John Kerwin, Beckwith, Cal.
462,569.—CURTAIN-POLE SUPPORTER—Emma Martel, S. F.
462,577.—CHECK BOOK—Edward North, Newhall, Cal.
462,326.—APPARATUS FOR TREATING ORES—A. B. Paul, S. F.
462,452.—ROTARY AIR-COMPRESSOR AND PUMP—H. Richman, Santa Cruz, Cal.
462,334.—ADDING MACHINE—A. Slavin, Tampico, Wash.
462,458.—BEDSTEAD—M. C. Taylor, Grass Valley, Cal.
462,645.—STRINGED INSTRUMENT—C. S. Weber, San Jose, Cal.
462,460.—AUTOMATIC ORGAN—G. F. Wells, S. F.
21,143.—DESIGN—C. H. Maish, Carson, Nev.

The following brief list by telegraph, for Nov. 10, will appear more complete on receipt of mail advices:

William T. Collier, Los Angeles, wardrobe; Earl D. Eddy, San Mateo, attachment for dental engines; Carol E. Gates, Oakland, fruit crate; Cotran T. Hall, San Francisco, hydraulic elevator valve; Legrand D. Harding, Colfax, Wash., differential in rolling-mills; John H. Hobart, assignor to T. M. Orahman, San Francisco, and N. H. Pine, Eureka, gold-saving apparatus; John B. Houston, San Francisco, metallic roll packing; Peter H. Jackson, San Francisco, damp-proof and water-tight cellar; James O. Kafader, Fort Bidwell, pipe punch and cutter; William Kidd, Fishermans Bay, Cal., cross-cut saw; Alexander J. McAdam, San Francisco, hydraulic elevator; William D. McCann, San Francisco, powder distributor; George W. McNear, Oakland, car construction; Joseph Moore, San Francisco, hose-holder; John F. Myers, San Francisco, stove for heating and lighting purposes; Charles H. Van Allen, Halsey, Oregon, mouth-piece for cornets; William Van Deventer, Tacoma, Wash., tail-piece for striged musical instruments; Albert E. Winlow, San Jose, Cal., buckle.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SHOE.—Geo. Bryant, S. F. No. 462,468. Dated Nov. 3, 1891. This invention relates to certain improvements in the construction of boots and shoes and it consists in forming the insole, to which the upper of the shoe is fastened, with a series of transverse grooves or channels across the top front part of the insole, and afterward securing to the shoe thus constructed one or more outer soles similarly grooved or channeled. Great difficulty is experienced in the manufacture of shoes to use a sole sufficiently thick to keep out the wet and for durability, and at the same time to provide a sufficient flexibility to make the shoe comfortable. These difficulties are claimed to be overcome by this invention.

ROTARY AIR-COMPRESSOR AND PUMP.—Henry Richman, Santa Cruz. No. 462,453. Dated Nov. 3, 1891. This patent covers certain improvements in rotary engines, which may be used for compressing air-pumping and similar purposes. It is one of that class of devices in which a circular disk or hub is fitted to revolve within an exterior case eccentric thereto, the hub having a sliding piston or pistons which may be alternately forced out at one side and the other, so that either one end or the other of said piston or pistons projects beyond the periphery of the hub and fills the space between it and the inside of the outer case, where the eccentricity of the two form such a space. The object of the invention is to provide certain improvements in the sliding pistons, a means by which they are alternately forced out and retracted, an automatically moving, self-adjusting packing fitted to the end of the pistons and a means for adjusting these pistons to or from the center of the hub.

SIGHT FOR FIRE-ARMS.—Fred W. Dobbel, Purissima, San Mateo Co. No. 462,475. Dated Nov. 3, 1891. This invention relates to that class of rear sights for fire-arms in which the sight is mounted and is vertically adjustable in a hollow standard hinged to a base which is secured to the gun-stock. The object of the invention is to provide a simple and effective means for the rapid adjustment of the sight. Quickness of action in this respect is of great importance, especially in hunting, as it often happens that the sight must be adjusted in the shortest possible time in order that the gun may be in readi-

ness for a sudden emergency. The ordinary sight in use is too slow for emergencies, as its adjustment is effected by the turning of a screw sleeve, which acts upon the threaded shank of the sight to raise or lower it. This movement is a slow one, and the necessity for its use may have passed before the adjustment can be effected.

BEDSTEAD.—Michael C. Taylor, Grass Valley, No. 462,458. Dated Nov. 3, 1891. This is an attachment to an ordinary bed by which it is rendered useful in handling sick and injured persons, those unable to help themselves, weak, infirm and aged persons and invalids. The invention consists essentially in a swinging arm attached to any portion of the bedstead and adapted to swing over and outwardly to one side of the plane of the bed, whereby the person can be suspended from the bed-arm and carried outwardly from over the bed while the latter is being made up. This bedstead can be used as an ordinary one but has an easily operated attachment called into action when the necessity arises, the purpose of which is to lift the patient from the bed and support him outside of it with comfort while the bed is being made up or arranged.

LEVER-POWER MECHANISM.—John Kerwin, Beckwith, Plumas Co. No. 462,490. Dated Nov. 3, 1891. The object of this invention is to provide a simple but powerful mechanism for such machines as toe-calk machines, shears, punches, tire-up-setters, etc., in which the material to be operated upon is placed between the opposing parts and is acted upon by said parts. The lever mechanism is specially applicable to machines having a movable part or jaw adapted to be forced upon the work.

CONSTRUCTION OF FLOORS OR WALLS.—Peter H. Jackson, S. F. No. 462,437. Dated Nov. 3, 1891. This invention relates to building basement, cellar or vault construction. The object is to increase the stiffness and strength of walls or floors of buildings without increasing their thickness, so that a building will remain integral as in condition of original construction, will resist tensile and compressive strain, remain erect under the weakening effects of fire, and will withstand earthquake shocks; furthermore to produce a construction of vault or cellar adapted for building where the ground affords a poor foundation; and also to produce a vault or cellar construction adapted for building where a larger surface than that enclosed by the walls of a building is required to support it owing to the earth being soft or wet beneath, and thus a poor resistant to the load above. With these objects in view, the invention consists in a building or similar structure comprising a wall or floor of two surface portions, each provided with metallic ties or small beams, whereby the wall or floor is stiffened and each portion made capable of withstanding strain; furthermore in a construction for buildings comprising a foundation, cellar or basement wall and a floor, both wall and floor being provided with metallic ties or beams joined, whereby the floor alone is made to form a firm, solid and substantial foundation for a building.

The Blasdel Concentrating Belt.

Saving a high percentage of sulphurets with the concentrator is of so much importance to mine-owners and millmen, that any improvement in that direction is likely to excite interest, and when proved a success, be met with a lively demand.

Among the several excellent machines now in extensive use, the part which has probably given most trouble to the inventors and builders, has been to secure a perfectly satisfactory belt.

While the belts now in use are doing good service and yielding fairly good results, it was the opinion of Ex. Gov. H. G. Blasdel, of Nevada, the inventor of the belt bearing his name, that room for improvement existed. This belief, based upon long experience and close observation of every detail connected with quartz milling, led Gov. Blasdel to give the subject careful investigation and to enter upon a series of experiments with the direct object in view at the time, of saving more, and a finer grade of concentrates than he had been doing at his mill in White Pine, Nev.

Success followed these efforts, and it was decided to place the improved belts upon the market, and to that end arrangements have been made to manufacture them in San Francisco. Orders for these belts can now be filled on short notice, in any width or length, and adapted to any of the Standard concentrators. The inclined flanged edge of the Blasdel belt enables it to pass over the rollers without breakage or strain, and, at intervals of four feet there are eight ridges for a space of three inches; these serve to distribute the pulp more evenly and prevents it from banking on the sides and forming channels through the center. These ridges also save very fine sulphurets (which are generally the most valuable), and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

The inventor's claims for these advantages are endorsed by practical mill-men who have seen the belt work, as the respectable number already in use (between 30 and 40 in less than a year) prove. Some of the mills where these belts are being used and tested are, the Original Empire M. and M. Co., North Star M. Co., W. Y. O. D. M. and M. Co., California M. and M. Co., of Grass Valley, Champion M. and M. Co., Nevada City. The verdict from these and others has been decidedly favorable, and the manufacturer feels assured from the increasing number of orders and inquiries, that wherever concentrates are saved his belts will come into general use as their merits become better known. See illustrated advertisement on another page.

MECHANICAL PROGRESS.

Regarding Fuel Gas.

The practical failure of the natural gas supply for industrial purposes, not only at Pittsburgh, but in other gas districts, has led to a renewed interest in the subject of fuel gas. The fact which has ever been before the fortunate users of natural gas—that the supply, at best, was limited, and the day of its exhaustion, or at least the impossibility of its economical use for industrial purposes was near at hand—has made the subject of the best and most economical fuel gas one that has always been full of interest to the natural gas consumer, while manufacturers in those sections in which natural gas has not been found have looked with longing for a fuel gas process that would give them the advantages of natural gas at as cheap or even a cheaper rate than solid fuel was costing them.

It is not our intention in this article to speak of the various processes that have been invented but there is one or two points in connection with fuel gas and the different systems for its manufacture that have been proposed, to which we wish to call the attention of those interested in the subject.

The first desideratum of a fuel gas process in the minds of many who desire to use the gaseous fuel is that it shall necessitate but little change in existing plants. While there are fuel gas processes that answer this requirement, we think it will be proven in the long run that the greatest efficiency and economy in the use of fuel gases will not be found in the retention of old plants. The conditions under which solid and gaseous fuel are burned, are so different that a plant that is well adapted to the burning of solid fuel cannot be readily changed so as to burn a gaseous fuel with the greatest economy. All such changes are, in the nature of things, only makeshifts, and the highest economy will be in the erection of plants designed for the use of fuel gas.

We think it will be found also, that gases made by certain processes are better adapted to certain uses than they are to others. Fuel gases may be roughly divided into three classes—water gas, producer gas and what, for want of a better term may be called illuminating gas. Possibly a fourth should be added to these—sprayed petroleum, which is not really a gas. When petroleum is made into a fixed gas it should be included under one of the heads named.

It will be found that each of these gases has its own use to which it is better adapted than to any of the others. Water gas gives a very high degree of efficiency, but is somewhat costly. Producer gas can be made in great quantities at a cheap rate, but cannot be transported to any great distance, while illuminating gas is of a comparatively high cost and can only be used where the industry requires gas in no great quantities and can afford to pay a high price.

To typify the uses of each of these gases it might be said that water gas answers admirably for welding purposes, producer gas for large operations—like rolling mills—and illuminating gas for domestic purposes and small manufacturing.

While there are several fuel gas processes that have great merit it must, in all fairness, be said that there are a great many others whose performance hardly justifies the claims made for them. Some of the most absurd and impossible claims are daily made for the gas manufactured by certain processes. Most marvellous stories are told of the number of thousands of cubic feet of gas that have been made by certain processes from a ton of coal or a barrel of oil—statements that are as absurd as to say that two and two make fifty. Sometimes the promoters of these processes are self-deceived; in other cases they are simply dishonest and show their dishonesty when parties desiring to investigate their processes, with the hope of using them, begin to make close inquiries as to methods of manufacture, analyses, etc.

In making these remarks we have only referred generally to some points in connection with fuel gas that it will be wise for prospective users to bear in mind, and have by no means attempted to point out all matters that they should consider, nor even to discuss thoroughly those that we have pointed out.—*American Manufacturer.*

NEW METHOD OF STEEL MAKING.—H. H. Lake of London is the inventor of a new method in the manufacture of steel. Hard steel has hitherto been manufactured in crucible furnaces, and owes its properties to the carbon and various metallic compounds which have been incorporated therewith. It may be defined as an alloy of iron, carbon, and such metals as chromium, wolfram, copper, manganese and the like. Its properties are obtained by combining the several ingredients in predetermined proportions, and by eliminating as completely as possible the other substances, such as silicon and manganese, remaining in the metal. The method, according to this invention, is applicable to steel produced either in small or large quantities, and consists in preparing the bath in such a manner that, with a minimum of deoxidizing foreign elements, the carbon and the metals necessary for the hardening shall be added exactly in predetermined quantities. Converter or Martin-furnace steel

being obtained at the desired degree of decarburization, the bath is deoxidized by a sufficient quantity of silico-spiegel, whereby is introduced a minimum quantity of silicon and manganese, with traces of carbon, manganese and silicon passing into the scoria. A predetermined quantity of aluminum in the form of rich alloys is then added. The aluminum can be used alone as a deoxidizing agent. In any case, the two alloys may be employed separately; that is to say, successively or simultaneously, for preparing the bath before the addition of ferro-chroms or other metals, the proportion of which can be varied with the degree of hardness which is to be obtained.

The New Process of Chain Manufacture.

The new automatic process of steel chain manufacture, an English invention, and which has already been briefly alluded to in these columns, is now being largely introduced. Under this improved process, as described by a correspondent of the *American Manufacturer*, the chain is stamped out of a specially rolled mild steel bar, of which the section is a cross, with arms of a great length, and the links, which are weldless, are egg-shaped and have solid studs. These studs, the absence of welds and the homogeneity of the chain, combine to make it peculiarly strong, and its resistance is enhanced by subjecting the links to pressure.

There are ten processes, all of which, except two are automatic, and all are applied to the cold metal. There are seven punching operations, and when these are completed the bar presents the aspect of a rigid chain, every link being united to its fellow at what is the wearing surface of an ordinary link. To break the union the chain is run between a press which is V-shaped top and bottom. The links while rigid, are at right angles, each to the other, and the press comes down between them in the angle and presses them together. Fitting into the angle, the whole force of the pressure is concentrated on the neck of metal which connects the links. The first pressure all but effects the separation, and when the links are repressed through the press, and forced back into their original position, the separation is completed, the fracture being as clean as if it had been cut with a punch.

Initial Want of Success.

Before this process of separating the link was adopted, the chain was subjected to torsion for the purpose, the chain being put into a machine which twisted it first in one direction and then in another. But this process was found to fatigue the metal too much, and none of the one-half inch chain operated upon withstood the strain, each of them snapping before the process of wrenching one link from the other was completed, and the inventor has now therefore substituted the simple process of direct fracture described and this answers well enough.

Advantages Claimed for the New Chain.

M. Rongier of Birmingham, who is the inventor of the new process, claims that the new chains have double the tensile strength of the best forged iron, and further, that a half-inch chain made in this way has a higher breaking strain than an open-link inch cable, and weight for weight, a weldless steel cable is something above 30 per cent stronger than the best stud-link welded cable. The tools at present mounted are making half-inch chain at a total cost which is computed at £16 10s per ton of 93 fathoms. According to tests made at Lloyd's this chain is equally strong with a one-inch welded studless iron chain, which is produced at £12 per ton of 36 fathoms. It follows that a piece of the latter chain equal in length to a ton of the former costs £30.

THE GROWTH OF SEAMLESS STEEL TUBE BUSINESS IN ENGLAND has been very rapid, both in this country and in England. Birmingham is the chief center of the business in that country, and so great has been the increase in the number of firms who have embarked in the industry that the trade is in danger of being quite "overdone." Cycle makers and engineers are the chief consumers. Indeed, wherever metal tubing is required that has to withstand a great strain, and where steel can be used, the seamless tube is in growing request. It has added materially to the efficacy and durability of hydraulic machinery; a three-fourths-inch tube with a core of one-third inch can be drawn in steel to withstand a pressure of 1000 pounds on the square inch, and it is now, as my readers are aware, being largely used for boilers instead of copper tubing. It costs very much less, while its life is as long, and when made of high-class steel, it is generally found to be quite as reliable as, if not, indeed, more so than ordinary copper tubes. I may add that our Government is just now using a large quantity for the construction of search lights.

WIRE-WOUND GUNS.—Wire-wound guns have received some attention at the hands of the navy department, and the bureau of ordnance is contemplating further experiments with them. By the Longridge system, the inside tube of the gun is surrounded for the greater part of its length by a series of concentric layers of wire, lightly wound, over which is shrunk a cast-iron jacket, which includes the trunnions. The great beauty of a wire-wound gun lies in the fact that it approximates much more closely to the all-important principle of

perfect initial tension than the other forms of built-up guns, and it can thus withstand safely a much higher chamber pressure than the latter. The other great principle of gun construction, that of varying elasticities, is subserved in the Longridge system, to some extent, by making the tube and wire of steel and the jacket of cast iron.—*Exchange.*

SCIENTIFIC PROGRESS.

The Wonders of Nature.

Nature presents numerous phenomena which call forth the wonder and admiration of her students. These are exemplified in all departments of her domain from the starry firmament above, the magnificent scenic effects on earth, the wonderfully magnificent growths of her primeval forests, the beautiful effects of her floral kingdom down to her infinitely minute specimens of mineral, animal and vegetable microscopic productions. Among her remarkable productions and provisions none, perhaps, are more wonderful or inscrutable than the grand and absolutely imperceptible manner in which she passes from animal to vegetable life, and from the latter to animal.

We have been led to these reflections by a recent illustration of a compound life—an insect and vegetable combined—a crawling worm with a vegetable growth springing and flourishing from the upper portion of its body—not an isolated case, a vegetable and animal sprout, but a natural, consecutive production of generation after generation.

Soon after viewing this picture, our attention was called to a similar marvel, which is described substantially as follows: The Department of State at Washington has recently received from Consul Jones at Ohinkiang, China, a small bottle containing some specimens of a curious fungus that grows out of a species of caterpillar, literally transforming the animal into a vegetable and causing the unhappy insect to serve the purpose of a root. It is the larva of a kind of moth which, when the cold of winter approaches, makes its way down into the soil to the depth of three or four inches. While thus encased it is attacked with a remarkable disease or permeated with a peculiar germ, from which a shoot is sent up above the ground, where it grows and fructifies much like a mushroom, forming spores for the purpose of its reproduction.

The natives of Thibet, where this remarkable production is common, go about looking for this fungus in the neighborhood of a certain sort of myrtle, near and under the branches of which only it is found. They dig up such specimens as they discover and make them up into little bundles, tied with red thread. In this shape they are sold as a medicine, which is esteemed, if possible, more highly than the famous ginseng, being considered a powerful curative agent for diseases of the throat and lungs. They are thus prepared for market, in little bunches, each sprig having for its root a mummified caterpillar.

Now, this fungus has no other method of growing than the one described. Therefore, the fructifying top that is above ground sends its spores around under the scarlet-flowered myrtles on which the caterpillars feed. When the latter borrow into the soil to hibernate, they stir up some of the hostile germs, whereupon they are at once attacked and speedily transformed into vegetable tissue. Their bodies, without losing their natural shape or external appearance, are wholly filled with the mycelium, and the substance of their flesh is metamorphosed into stalks sprouting from their heads.

Thus is afforded the remarkable spectacle of living organisms which are insects in summer and plants in winter. Of course, a sufficient number of these afflicted larvae must escape this fate to perpetuate their species from year to year and to supply reproductive opportunities for the fungus.

THE DIPPER AND THE NORTH STAR.—Most people in a clear day, can, without a watch or other timepiece, form a closely approximate idea of the time of day by the position of the sun; but few, perhaps, have guessed at any similar method of computing the time during the night without any other means than the "starry skies." Notwithstanding, a fairly reliable time indicator can be found in the northern skies on every cloudless night. As is generally well known, the group of fixed stars called the "Dipper" makes an apparent revolution around the North star in every 24 hours, with the two stars forming the outer elevation of the bowl of the dipper pointing nearly directly to the polar star continuously. If the position of the "pointers" is taken at any given hour, say six o'clock in the evening in winter time and as soon as it is dark in the summer, the hours can thereafter be pretty accurately measured by the eye during the night. Frequent observations of positions will have to be made at the given hour, as, owing to the constant changing of the earth's position in space, the position of the "pointers" in relation to our point of observation and the star, also change. Observations taken during a year and impressed on the mind will make a very good time indicator of that part of celestial space.—*Mechanical News.*

A NEW SMOKELESS POWDER.—Professor Charles E. Munroe, a graduate of Harvard

University, has produced a new smokeless powder which has been tested at the United States naval ordnance experiment grounds, and is said to have given eminent satisfaction to the government officials. Eleven rounds were fired from six-pounders, a charge of 400 grammes giving a velocity of 1960 feet and a pressure of 16 tons; with a charge of 392 grammes the velocity was 1920 feet and the pressure 14 tons. With the ordinary service charge of 820 grammes of black powder, the velocity was 1800 feet and the pressure 15½ tons. The results obtained with three-pounders are said to have been still better, the trials comparing well with anything that has been done in Europe. The new powder is almost entirely smokeless, but it is necessary to use with it a small priming charge of black powder, which causes a slight puff of grey smoke that quickly disappears. Gun-cotton is stated to be the basis of the new powder.

PICTURES IN SULPHUR.—Our readers are already acquainted with the fact that molten iron, when cast upon ordinary writing or printing upon paper, will take a perfect mold of such writing or printing, which will be plainly discernible upon the face of the casting; and now comes the announcement that the same result can be obtained from sulphur when pressed, in a fused state, over any picture or words lithographed upon paper, and, presumably, writing as well. Charles Lepierre, in the Bulletin of the Society of Chemistry, Paris, says that: "In demonstrating that sulphur melted at about 115 degrees can be cooled in paper, the author happened to use a lithographed card, of which the edges were turned up. Upon taking away the card he discovered that the lithographed characters were clearly and distinctly impressed upon the cooled surface of the sulphur, and remained after hard friction and washing. By repeated experiments he has been able to get very fine results, removing the paper each time by a mere washing and rubbing process. He finds that sulphur will receive impressions from and reproduce faithfully characters or designs in ordinary graphite crayons, colored crayons, writing ink, typographical inks, china ink, lithographic inks—colored or uncolored—and others. He remarks, too, that it will reproduce with remarkable exactitude geographical maps."

OREXIN.—Dr. John Gordon reports in the *Lancet* on his results in the use of hydrochlorate of orexin, as an appetizer. From these he concludes that, in the loss of appetite concurrent with tubercular disease, orexin is a valuable stimulant. The power of stimulating absorption of the products of digestion claimed for it, seems to be merited, for under its use, as a rule, the tongue becomes less furred, and constipation relieved. It is worthy of receiving an unbiased trial in suitable cases. It may be given, he says, either well diluted in water or made into pill form with any of the ordinary excipients, and can also be given between thin slices of bread or butter or in the form of wafers. The cases in which he tried it were those of children, to whom the drug was given in small doses and simply dissolved in water. Little or no objection was offered by the children to its administration.

MORE NEW DYES.—Three new shades of diamine blue have been recently introduced by Messrs. Leopold Cassella & Co. The diamine blue 2 B and 3 B give very pretty shades. These blues are not turned red by the action of alkalis or hot pressing, an advantage not shared by any other direct blue dye. A fast neutral violet B is another new dye specially suited to cotton printing. Cotton can be dyed in the usual way on tannin and tartar emetic mordant. It will be found useful as a substitute for alizarine and methyl violet, especially for the deeper shades, as under these conditions the new violet does not develop a bronzy tinge.

RAIDING OUR CLIFF DWELLINGS.—Baron Nordenskjöld of Sweden, who secured permission to visit the cliff dwellings on the reservation near Dorango, Colorado, with the understanding that he would neither destroy nor carry away any of the relics, went upon the work of general devastation upon arriving there. He has shipped several boxes of relics to New York. When the baron reached Dorango upon his way East he was arrested by a United States marshal, charged with robbery, and will be prosecuted to the fullest extent.

A PERSONAL VOCABULARY.—The vocabulary of a citizen of the United States, with a common-school education and of ordinary intelligence and reading, is about 10,000 words, and that of a well-read college graduate and of those who have pursued a university course, at from 20,000 upward to perhaps 100,000. One's vocabulary is usually nearly complete at 30 years of age. If but two words are learned each day, the vocabulary at that age would be only 20,000. Records show that young children acquire new words more rapidly than that.—*Science.*

NUMEROUS ISLANDS.—It is said that between Madagascar and the coast of India there are 16,000 islands, only 600 of which are inhabited. The climate in those islands is so productive of food that a man can support a family there, in all those island luxuries, by the work of only 25 days in a year.

ELECTRICITY.

The Improved Uses of Electricity.

Dr. Louis Bell recently read an interesting paper before the Franklin Institute on "Electricity as the Rival of Steam." The author, in the course of his paper, remarked that we must still look upon electricity not in any sense as a prime mover, but simply as a powerful and convenient means of transmitting power from one point to another. It was also to be inferred that only in exceptional cases could anything but steam be employed as the prime mover. This inference was necessary because, up to the time of the writing of that paper, we had no means of transmitting power by water for any considerable distance, five miles being the longest distance of transmission, and even that at a very great loss of power.

Since that time, however, the Frankfort experiments have shown that electricity may now be transmitted upward of 100 miles, at a less loss than has heretofore been met with in a five mile distance. This fact has added immensely to the possibilities of the uses of electricity. By this increased control over the electric current, it is possible to utilize water power from great distances, and streams which have heretofore been considered of little or no worth are now regarded as of great value. Water-power may now be economically and safely transmitted from any of our mountain streams into any or all of our great interior valleys and made to do all that steam can do on the spot. Such power may be made to light cities, run factories or drive trains of cars on our railroads. Power may be "hotted up," so to speak, and sent along a hundred miles of wire or more at a slight expense, divided up to any desired extent, and made to do all the work required of any power at any desired point. By this means, after a plant is once installed, the cost of power will be light—a mere bagatelle of what it is now.

Electricity on the Railroad.

We have already in previous issues, alluded to the new possibilities of what electricity may shortly accomplish in the way of displacing steam on our great railroads. There is only one man in the world whose opinion would be accepted for what he promises in the near future. That man is Thomas A. Edison. Mr. Edison, in speaking of electricity displacing steam, says: "It will displace it, if economy as well as speed and safety, is a factor of locomotion, not because it will make easily a speed of 100 miles an hour, while steam strains itself to make 60, but because it will get one horse-power out of from one to two pounds of cheap coal (water-power), while out of six pounds of dear coal a locomotive engine can only get that same one horse-power. It will displace it because it will be cheaper."

Thus this greatest of inventors unhesitatingly announces the early ending of the present era of steam, and the birth of the new and improved, but not yet perfected era of electricity.

It is expected that the first authoritatively practical evidence of its wonderful achievement will be made at the Columbian Exhibition in Chicago—a most appropriate beginning of a new era of progress at the ending of the first 400 years of any real industrial progress which the world has ever made.

Mr. Edison declines to go into full details of all that he has in hand at this time, as he has not yet secured European protection and possibly has not fully perfected all his details in regard to moving overland trains. "But," he says, "I will say briefly that the current will pass from the stationary engine to a central rail between the tracks, thence through the mechanism attached to the bottom of the cars or motor, (a freight train, of course, would need a motor, because of the number of cars, although a single passenger car could be run, carrying its own motor beneath it) thence to the wheels and thence back by the side rails to the power-house or stationary engine. Three of these stationary engines with a horse-power of 10,000 or 12,000 each would run the whole Pennsylvania railroad system between Chicago and Philadelphia; freight, local, express trains and all, and at a great reduction of expense."

In alluding to this street car problem, Mr. Edison illustrates his low power system, which makes the transmission safe and at the same time all-powerful, as follows: "You see I employ the heavy current with the low pressure. That is the whole secret of safety. The principle is this, that a stream of water 100 feet wide, which falls a foot, gives the same power as a stream one foot wide which falls 100 feet. The wide stream is my way, the high fall some other people's and the allowance of such pressures in public streets as some that are used, is like letting a man place a boiler in a vault under a street and put on 1000 pounds of steam if he wants to do so. Electricity has developed too fast, you see, for the law to keep up with it. The whole question is one of expense. A low pressure trolley wire, for instance, occupies four times as much copper as a high pressure one. This system is the cheapest known and does not cost half as much as the cable."

A SIMPLE VOLTAIC BATTERY.—A novel and simple form of electric battery has recently been invented in Italy, and is described in the London *Electrical Engineer*. It consists of conical vessels of cast iron and porous earthenware, with nitric and sulphuric acid. An iron

cone is placed point downward in a stand, and is partly filled with strong nitric acid. Into this is placed a cone of porous earthenware containing dilute sulphuric acid. Then follows an iron cone, surmounted by an earthenware one, and so on in a series, each vessel containing its respective acid. It follows that the inner surface of each iron vessel is bathed in nitric acid, and becomes passive, acting the part of the platinum or carbon in an ordinary cell. The outer surface is attacked by the dilute sulphuric acid, and takes the place of the zinc. There are no connections to make, the simple building of the pile putting all the parts into motion. The earthenware cones are eight inches in diameter and four inches in height, and contain 550 cubic centimeters of 10 per cent sulphuric acid solution. The iron vessel contains 110 cubic centimeters of nitric and sulphuric acids—the latter being three times the volume of the former. Sixty elements in two piles have a resistance of 104 ohms, an E. F. M. on an open circuit of 81 volts, and on closed circuit of 45 volts, with a current of 4.4 amperes. After five hours, the difference of potential falls to 28 volts, and the current to 2.7 amperes.

Perversion of the Term "Electric."

Electrical Review very properly says the word "electric" is perverted to base uses. "To the uninitiated, this word carries a world of mysterious, subtle and powerful meaning. We see extensively advertised the merits of electric hair curlers, electric soap, electric tooth brushes, electric knife sharpeners, and hundreds of others. This is a swindling prostitution of a noble word to help the sale of articles not connected in any manner with anything electric. The onus for this lies in the education of the public in matters electrical, so that they may know of their own knowledge what to trust and what to avoid, when they see or read anything 'electric.'"

A contemporary of this city, in copying the above, adds the following, which is not only cumulative, but also quite to the point: "We remember a year or two ago, when the California Electric Society was being organized, a notice was put in the different dailies, asking those interested in electrical matters to meet at a certain hall. When the evening came, the hall was well filled, but many present looked like cranks that had made their escape from some asylum. They turned out to be 'electric doctors,' 'electricians,' as they called themselves, who had been attracted by the word electrical. There is another class of men that misuses the word. They are the bell-hangers who advertise themselves as 'electricians,' and lastly, we have the men who, having oiled a dynamo for a few months, come out as full-fledged 'electrical engineers' and 'experts.'"

It is unfortunate that such a good word should be put to such base uses, but so long as the world is filled with fools who believe what they hear, but do not understand, the evil will go on unchecked.

HOW SEVEN ELECTRIC SHOCKS FEEL.—Conscious motion is not a proof of suffering from an electric shock. Moreover it is well known that a severe shock of electricity may produce unconsciousness when the result is not fatal. Franklin describes an experiment in which he knocked down six men at once by an electric discharge of which they did not see, hear, or feel anything. The following experience, however, says Dr. C. A. Perkins, in the *Electrical World*, is different from anything that has ever come to my notice. Mr. H. was working on a trolley car. He was wearing at his work an old pair of shoes with iron nails and no insoles. Standing with one foot on the rail of the dashboard he took hold of a wire that was accidentally connected with the trolley line, and at once received the whole force of 500 volts. He was unable to call for assistance, but was sufficiently conscious to know that he must pull his hand off the wire and break the connection, and by a strong exertion he succeeded in doing this, wrenching his hand away and falling over. By some chance he turned around as he fell, striking on his knees and shoulder, and so escaped any serious injury from the fall. The curious thing about it was that he suffered no pain during this time and did not feel the blow of striking the ground, but imagined that he was a great bird, sailing slowly round and round, finally lighting on the ground. He was able to get up immediately, and beyond feeling lame and stiff from the fall experienced no bad effects from the shock. This condition of semi-consciousness seems to be about as far as one could go without fatal results if he were dependent upon his own exertions to extricate himself. It seems, however, that even conscious motion under such circumstances is not proof of suffering.—*Exchange*.

COMPARING THE ELECTRIC WITH STANDARD CANDLE LIGHT.—In a communication to the Paris Academy, M. A. Witz states that the efficiency of an arc light is about .05, while that of a standard candle is only .01, and that of the best regenerative gas burners is perhaps .02. He mentions that in the town of Lille gas lighting has been supplanted by a system of glow and arc lamp, driven by a gas engine, and they have proven so much superior that 15 per cent more light is obtained, while the consumption of gas in the engine is 17 per cent less than was before required for direct lighting by gas.

GOOD HEALTH.

Effects of Overeating.

It is a settled fact that the average American eats too much, and especially is this the case during the long hot days of the summer season. In winter any excess of food may be stored up as a reserve supply, furnishing a protection, as it were, from the severity of winter's blasts. During this season, most men are gormands and form gormandizing habits. When the summer comes on, with its excessive heat, this extra supply of fuel is not called for, and yet your average American, never stopping to think that a change in diet must be made to suit the change in surroundings, continues to stuff that "aching void" with pork, beef, beans, and all the rest of the heaviest, most nutritious food-stuffs. His digestive tract is overloaded. Under the enervating influence of the heat, and the consequent inactivity of the muscular system, the digestive tract loses its tone, its power of handling the immense quantities of stuff thrown into it, and as a result it is not long ere strange misgivings enter the mind of your gluttonous individual. The world seems to go wrong. All things seem out of joint. He eyes the bootblack, who looks up innocently with the business-like remark "Shine?" with a suspicious scowl. His digestive tract is out of shape. Nine-tenths of the disturbances of the alimentary canal are due to indigestion feeding. Now, you who read, pay attention! Your stomach is not a bag of rubber, to be stretched to its greatest powers of endurance, nor should the sensation of complete satiety be taken as the index of the quitting point. Stop at the point of moderate satisfaction, and allow your stomach to resume its natural condition of moderate dilatation. Under these conditions, the digestive tract will take up the food, handle it thoroughly, abstract all materials requisite for the healthy nutrition of the body, and you will go on your way rejoicing.—S. A. G., *Texas Health Jour.*

STAMMERING.—The following remedy for this annoying trouble is highly recommended by a distinguished French physician: Draw a long breath so as to fill the lungs to their utmost extent. Divide the sentence you wish to speak into syllables, marking time for each syllable by bringing the index finger and thumb of the right hand together, or marking time with the foot. Now, here is a specimen: "Pass-me-the-bread. Good-morning-madam-how-do-you-feel-this-morning?" These syllable exercises must be practiced for at least one month, then a cure should be accomplished if the patient has no deformity of the throat or larynx and if the front teeth are sound. There is nothing easier than this cure; it is simply to speak in syllables for one month, and is within the easy reach of everybody—man, woman or child. Very few women or girls stammer, and they are the easiest to cure. I advise all parents to try and cure their children when they are young, if they stammer, and thus save them a life of misery. This cure was given in the *Old Household* ten years ago. Reading with the mouth shut will never cure stammering. Speaking in syllables is the cure of Dr. Colombat of Paris, who cured thousands and made a fortune.

A POSSIBLE REMEDY FOR SNAKE BITE.—It is well known to many that the Indians of Southern California have very little dread of the bite of a rattlesnake, as they always have what they consider a sure remedy at hand. When bitten, they immediately gather some of the leaves of the common mock orange—"golondrina" of the botanists—a vine which trails on the ground and produces a gourd which presents an exact resemblance to the orange. This vine grows almost everywhere in Southern California. In application, the leaves are macerated and formed into a poultice which is applied to the wound. The macerated leaves are also placed in water, and a decoction from the same used freely as a drink. We have never seen this statement contradicted; neither have we ever heard of its being verified by any physician. Here is a chance for some physician to render a noble service to humanity by experimenting with this plant on some small animal and reporting the result. If successful, some way might be devised for preserving the leaves and preparing a drink which might be placed upon the shelves of druggists and used in localities where the plant is not known and does not grow.

FRECKLES AND THEIR TREATMENT.—There are two kinds of freckles. Some people are born freckled and others have freckles thrust upon them. The former class might as well accept their freckles as a dispensation of Providence, for nothing can be done for them. The latter can always get rid of their affliction by using a couple of drachms of salomoniac with an ounce of German ointment, the solution mixed with a pint of distilled water. Applied two or three times a day, it will cure the worst case of acquired freckles on record. Another remedy is fresh buttermilk. It has the great advantage that it does not injure the skin, but renders it soft like a little child's. Take a soft cloth or sponge and bathe the face, neck and arms thoroughly with buttermilk before retiring for the night, then wipe off the drops lightly. In the morning, wash it thoroughly and wipe dry with a crash towel. Two or three such baths will take off all the tan and freckles. It will keep the hands soft and smooth.

NEW REMEDY FOR HAY FEVER.—An English physician, Dr. Lennox Walnwright, affirms that a mixture of menthol and carbonate of ammonia has proven to be the best remedy for hay fever. It is used as smelling-salts.

USEFUL INFORMATION.

THE MANUFACTURE OF SPECTACLE LENSES.—The forming of lenses for use in making spectacles is by no means a small job. The glass is treated to a number of processes, and when it comes out complete it has passed through considerable. First, the bit of glass to be used is made fast to a block of hard rubber, so that it may be handled more readily, plough being employed to fasten it. What is known as a "rough tool" is first used. This tool is of cast iron, having a curvature equal to that desired in the lens, and revolves very rapidly on a vertical spindle. It is kept moistened first with a coarse grade of emery and water, and the bit of glass is pressed against it. As this process continues, the grade of emery used gradually grows finer, and when thorough with the grinding, the glass is left with a rough surface and has lost its transparency. The next tool used is the "fine tool," which is of brass with the truest possible surface, and which is kept covered with rouge. In order to assure accuracy, comparison of the glass is made from time to time with a standard curve. Next comes the polishing, which is done by pressing the glass against a piece of cloth, fastened to the rotating tool and covered with the rouge. The lens is then ground on the reverse side, and, as far as polish goes, is complete. It must now be cut into the proper shape. This is done by means of a diamond. The lens is laid on a leather cushion and held secure by a rubber-tipped arm. An oval guide is then laid on the glass and the diamond run around it. A pair of steel pincers removes the superfluous glass from about the edges, and after having these edges ground smooth, the lens is ready for mounting.

SAWING STONE.—French ingenuity has contrived an improved stone-cutting saw of remarkable efficiency—a circular saw having its edge set with black diamonds in the same way as the straight blades, but as the strain on the diamond is all in one direction, the setting can be made much firmer. Moreover, as the movement of the circular saw is far more rapid than that of the straight one, the effect of the diamond teeth is increased by the force of the impact upon the object to be cut without the exertion of more power in propulsion. In order to keep this kind of a saw at starting in perfect plane, it is made to revolve between two pairs of guides, but as soon as the cut in the stone is deep enough to serve as a guide, the temporary ones are removed, the consequence of this management being that the out surfaces of the stone, instead of being wavy, so as to require subsequent dressing to a plane surface, are quite straight and smooth, needing only to be polished. The stone to be cut is pushed against the saw by a carriage similar to that used in sawing wood, and the rapidity with which it is divided is very great. At one establishment where two saws are in use, the green Alpine granite is sawed at the rate of nearly an inch a minute, hard marble at three inches a minute, and marble of moderate hardness, also hard limestone, four inches a minute.—N. Y. Sun.

BLASTING PAPER.—Almost any good unsized paper can be made into an explosive compound by coating it with a hot mixture of yellow prussiate of potash and charcoal. Take each of these, 17 parts, mixed with refined saltpetre, 35 parts; chloride of potassium, 70 parts; wheat starch, 10 parts, and water, 1500 parts. The ingredients must be dissolved until they form a clear solution in the water. Dip the paper and soak it in the solution until it is thoroughly wet. It then may be dried, rolled into cartridges a dried in the ordinary manner, either with a fuse or with detonating caps similar to those used in firing cannon or dynamite when used in blasting ledges. Blasting paper is especially useful in operating the gun-powder pile-drivers, as several thicknesses of the explosive paper may be placed on top of the timber together with an explosive cap, and fired by impact of the ram as it falls from the previous stroke. Cartridges of this paper may be rolled to any desired size, and are very handy when blasting a wheel pit or flume, as the cartridges can be made of exactly the size to fill the drill hole.—*Mechanical News*.

HAS NO GALL BLADDER.—Nothing on earth will upset a horse's stomach, according to *London Truth*. This is not because the horse does not feel pain, but simply because the horse has no gall bladder. Has anybody ever seen a horse sick at sea? Has anybody ever known an emetic to have any effect on a horse? At a bull fight a horse may be seen eating with its entrails trailing on the ground. As for the contention that a horse is not as sensitive to pain as man, I think that a horse is probably a great deal more so. There is no living creature, not even a hysterical woman, so nervously sensitive as a horse.

AN ELECTRIC LAMP does not compete for the oxygen of the apartment in which it is placed, and this circumstance gives it a marked advantage over any open flame.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Electric Mining Locomotive; Gould Electric Pump, 309, Von Schmidt Suction Dredge, 317.
EDITORIALS.—Electric Mining Locomotives, 309. Passing Events; A Nevada Mining Law Ignored; River-Bed Dredging; Secretary Foster on Silver; Comstock Low-Grade Ores, 316. Mining Dredger in Victoria, Australia, 317.
MECHANICAL PROGRESS.—Regarding Fuel Gas; New Method of Steel Making; The New Process of Chain Manufacture; Miscellaneous, 314.
SCIENTIFIC PROGRESS.—The Wonders of Nature; The Dipper and the North Star; A New Smokeless Powder; Pictures in Sulphur; Grexins; More New Dyes; Raising Our Cliff Dwellings; A Personal Vocabulary; Numerous Islands, 314.
ELECTRICITY.—The Improved Uses of Electricity; A Simple Voltaic Battery; Perversion of the Term "Electric"; How Seven Electric Shocks Feel; Comparing the Electric with Standard Candle Light, 315.
GOOD HEALTH.—Effects of Greasing; Stammering; A Possible Remedy for Snake Bite; Freckles and Their Treatment; New Remedy for Hay Fever, 314.
USEFUL INFORMATION.—The Manufacture of Spectacle Lenses; Sawing Stone; Blasting Paper; Has No Gall Bladder; An Electric Lamp, 315.
MINING SUMMARY.—From the Various Counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 312-313.
MINING STOCK MARKET.—Sales in the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 322.
MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke, etc., 322.
MISCELLANEOUS.—What California Mining Needs; The Drilling Contest at Denver; The Coalings Oil Fields; Southern California Oil Fields; The Blue Lead; Alaska's Mineral Wealth, 310. An Unjust Decision; Use of Water for Milling; Texas Alien Land Act; Southern California Mines; Gil Developments; Low Grade Ore; Amador's Resources; Mining at Austin; A Gold Experiment, 311.

Passing Events.

The commencement of thorough experiments to test a method of economical working of low-grade Comstock ore, is an important thing for that section. In fact, an entire reorganization of the milling customs up there would doubtless be a good thing, and would give people more confidence in investing in the mines, with a view to dividends.

The advance in the application of electricity to mining has been very great recently, and the PRESS is taking some trouble to present the subject to its readers from week to week.

There is quite a flutter among political horses and politicians in this city, owing to the action of the Grand Jury in investigating certain actions in which bribery and corruption are apparent. Indictments have already been filed against some of the more prominent, and more will doubtless follow. The men who have been guilty of accepting bribes for official acts ought to be punished, and for the first time in many years, indications point to some definite action in that direction.

GARNETS.—Garnet mines are not so numerous in this country as gold and silver mines, says the *Lower Californian*, but they are here, though. J. M. Brown and his partner, just in from the desert, report finding a mine of real garnets in the Carga Muchacha range of mountains. The mine is situated in United States territory, not far from the only spring in a section of country many miles in

area, and the garnets are said to be there in great quantities. They are a brilliant cherry-red in color, some of them black, and many as large as peas and perfect in shape. By sandblasting they can be rendered very beautiful and valuable. The discoverers have each taken up 20 acres of land on which the mine is located.

A Nevada Mining Law Ignored.

There are mining incorporation laws in this State, which are, so far as many mining companies are concerned, a dead letter, and it is for the recognition of these laws that the MINING AND SCIENTIFIC PRESS has made a strong fight, so that the proceeds derived from all bullions sold will be honestly divided, after all legitimate expenses incurred are paid. If these laws were faithfully carried out by mining officials, there would not be any just grounds for complaint from shareholders not members of favored rings.

While the laws in this State are being disregarded by some of the companies incorporated under them and working mines in Nevada, it appears that some of the mining laws in the latter State have not been conformed to by them. Notably is this the case when assayers fail to keep a record of all assays, purchases and sales of amalgam, and also of the bars of bullion, made by them. The history of this law being enacted by the State of Nevada, is briefly stated as follows: Several years ago, during the "bonanza firm" days, John W. Mackay discovered that some one was unlawfully appropriating amalgam from one of his mills, and as the law did not compel assayers to make, as stated above, a record of their purchases and sales of amalgam, and also of the bars of bullions made by them, he was unable to trace the loss to any particular person or persons, consequently, at the session of the Nevada Legislature he was mainly instrumental in having the following law passed:

4713. Sec. 1. Every person or firm now engaged in, or who may hereafter engage in the business of assaying within the State of Nevada, shall make and file, at the end of each and every month, with the County Clerk of the county where such business is pursued, a sworn return, subscribed with the name and verified by the oath of the person having the charge and control of such business, which return shall set forth the name and place of residence of every person within such month depositing or selling bullion or amalgam for melting, retorting, refining or assaying, together with the date of the deposit, the amount then deposited, the names of the mine and mill, blanket, sluice or other source from which the same was obtained.

4714. Sec. 2. Every person or firm within the State of Nevada engaged in or carrying on the business mentioned in the first section of this Act, who shall neglect or refuse to comply with its provisions, or any of them, shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be punished by fine of not less than one thousand dollars and not more than five thousand dollars (\$5000), and shall be imprisoned in the county jail not less than one month, nor more than six months, for each and every such refusal or neglect.

The above plainly worded law has been ignored probably by virtue of conditions brought about by the reported "mill ring" said to have been formed in 1885 and 1886. Last August, Wm. T. Baggett, attorney for the Mining Stock Association, was in Nevada compiling the bullion return of the Comstock mills and mines covering a period of several years back, and finding no record of large quantities of bullion which had gone into the hands of private individuals in place of the mines from which it was taken, and desiring to trace this valuable bullion from its fountain-head to its final resting-place which, is said to be in the pockets of a few favored individuals, he applied to the County Clerk of Storey county for the record filed with him. No such record having been kept, and some of the assayers being defiant, Mr. Baggett informed the District Attorney of the county that the law was being disobeyed. As a result, we find that the Con. Virginia assay office was the first to comply with the law and file its September work in accordance with the act. Considering the fine and imprisonment clause, it would seem advisable for the other assayers to follow the example set by the Con. Virginia assayer before some citizen feels obliged to force the District Attorney to proceed against them and put this most important law in the interest of mining shareholders into effect in a manner that will cause the disobeys to remember that laws cannot be disregarded much longer.

Comstock Low-Grade Ores.

It is stated that the Comstock Companies are to give the use of the Mexican mill, now lying idle, to Louis and Alexis Janin to test the Janin process for working the low-grade Comstock ores. What the nature of this process may be, is not made public in detail, but it is said to have worked satisfactorily in Mexico, where the percentage saved has been high, with some slight reduction in the cost of working. The Janin brothers are to carry on the work at their own expense, the companies to furnish mill and power. No new machinery or additional labor will be required for this process, the same appliances and staff of men answering all purposes.

It is a subject of congratulation that these important experiments are to be made by skilled and educated gentlemen who understand their business. They are both experienced mining engineers and metallurgists of the class to whom all such experiments should be referred. It has been unfortunately the case too frequently in the past that such matters have been entrusted to men with no professional education or experience.

It is pretty certain that the mining and metallurgical interest of the coast would have been better off to-day had educated mining engineers been employed instead of the class who too often have charge of important works. The examination of mines, the determination of process, and all such matters, should be referred to the professional mining engineer. The so-called practical man can carry out the work, but it should be under the supervision of one who has more than local experience.

The experiments with the ores on the Comstock will surely be carried on by the Janin brothers in a way which will leave no doubt as to results. There is no danger of a glowing report being made unless conclusions warrant it. It is greatly to be hoped that these experiments will be successful, and that a way will be found to utilize the low-grade ores of the famous lode.

River-Bed Dredging.

We have received a note from the Superintendent of the Carson River Dredging Co., enclosing a paragraph from the *Lyon County Times* (Nev.), contradicting the statement concerning the change in method of dredging, which we had copied in the PRESS of Oct. 31st from the *Virginia Enterprise*. The latter paper stated that the dredging machinery was to be done away with, a railroad built upon the bank of the river and the machinery placed on a car. This statement we copied, and commenting upon it, prefaced the paragraph by a statement that dredging operations for gold in rivers in California had not been successful, though in Australia some success had been met with. The *Lyon County Times* says:

The dredging scheme has not proved unsuccessful on the Carson river any further than that the company has never had the right kind of dredge for the work. The suction dredge which was first put on to recover quicksilver alone did not work, and the scoop dredge next put on failed because it was never intended for the work required by the company. The machinery now being put upon the boat is being made by the Golden Gate and Miners' Foundry of San Francisco. Mr. Angell, a representative of the foundry, visited Dayton a few months ago and saw exactly what was wanted. He is now putting up an endless chain bucket dredge, which he guarantees will do the work required by the company. Articles such as appeared in the PRESS are misleading and should be corrected.

This simply proves what was editorially said in the PRESS of the date referred to, as follows: "Over in the Carson river, Nev., for some years experimental dredging operations have been going on for rich tailings and quicksilver, but as appears further on, no success of moment has been met with, and the plans have had to be radically changed."

The PRESS has no desire to throw out any false impressions that may injure a persevering and legitimate mining proposition; but the fact remains that the dredging on the Carson river is still in an experimental stage after several forms of machinery have been tried. As to the paragraph from the *Enterprise*, that is incorrect, as the one printed above from the *Times* shows.

We shall be very glad to chronicle a success on the Carson river, especially as we never have made a success of such enterprises in Cali-

fornia. It is but just to say, however, the Carson scheme is to get up tailings, while in this State we have gone after original deposits—and never found them. As stated in our original article, they are working dredges in Australian rivers, and one of the machines used there—invented in this State—is illustrated in this week's PRESS.

The Height of Mt. St. Elias.

[Written for the PRESS by MARK B. KERR.]

In a recent dispatch from Washington appears the notice that Prof. Israel C. Russell has established his claim that Mt. St. Elias is the highest peak in North America.

As topographer of the expedition of 1890, I feel somewhat responsible for the approximate result obtained by us on this survey, and a few remarks upon the great discrepancy existing in the different estimates, as well as the method used by us in determining its elevation and position, may prove of interest at this time.

Since 1741, when Bering discovered the great peak, there have been seven different estimates made for height and position, and these are tabulated below:

MT. ST. ELIAS.		
Date	Authority.	Height in feet.
1786—La Perouse.....	12,672
1791—Malaspina.....	17,851
1847—Tebenoff.....	16,938
1872—English Adm. Chart.....	14,970
1874—U. S. Coast Survey.....	19,500
1890—National Geographic Society and U. S. Geol. Survey.....	15,350
1891—National Geographic Society and U. S. Geol. Survey.....	18,500

*Within 500 feet.
These different results show a range from 12,672 feet to 20,000 feet.

Up to 1874, the height was obtained by observations from a point at sea, by trigonometric survey, with unclosed triangles, the sides of the triangles being always long and coefficient of refraction assumed.*

The work of the expedition of 1874 would have forever set at rest all conflict as to height and position, but only one point of the base line was permanently established on land, the other end being far out to sea and not inter-visible. The knowledge of this uncertainty led to the exposition of 1890.

In 1890 we measured a small base line, 3850 feet in length, on permanent ground, deciding it better to have this fixed base and extend our triangulation from it, than to measure a longer base over shifting moraines of dirt and ice.

The accidental loss of the transit made resort to an inferior instrument necessary, and this combined with the region traversed (the line of travel being too direct for a proper development of triangles) would not give the highest value to this determination of position and altitude, but within the approximate trigonometric control, the limit of probable error is readily obtained.†

The angles of intersection on Elias are all small. As the ascent of the mountain was not our prime object, we were too late to succeed in reaching its summit, although we missed it by only a few hours.

Combining all angles with the compass angles taken at end of season of 1890 at Port Mulgrave (one end of the assumed base line of expedition of 1874), a distance Mulgrave-Elias is computed 56.16 miles within 5 miles.

This distance was computed in 1874 at 69.10 miles. All this shows that these discrepancies are entirely due to the difference in determination of distance.

It was hoped that the expedition of this season in charge of Mr. I. C. Russell of the Geological Survey would settle the question by succeeding in reaching the summit of the great peak.

But until a set of systematic observations has been approved by the National Geographic Society, the Geological Survey, or some well-authorized Government or private expedition, doubt will be felt by the scientific world as to its exact height and true position.

So the ambition of mountain-climbers the world over has been provoked by these different failures, and their desire strengthened to take its scalp. But one thing is certain—the American flag should be the first to float over Mt. St. Elias, and may the man who puts it there arrive when the tide of its elevation is on the ebb.

*Coefficient of refraction used in computing heights in this vicinity, determined by Prof. George Davidson, U. S. Coast and Geodetic Survey.
†Independent result obtained from Kerr's notes by E. M. Douglas, Topographer U. S. G. S.

San Francisco, Cal., Oct. 29, 1891.

Mining Dredges in Victoria, Australia.

The principle of working river beds and shallow alluvial flats by means of dredging has been subjected to a series of practical tests in the Owens district, Beechworth District, Victoria, Australia. The Woolshed Valley G. M. Co., with machinery in an experimental stage, believe that more dirt can be operated upon than by any system hitherto practiced for working such ground. They have an engine, and modification of the centrifugal sand-pump, lifting the earth, sand, etc., 49 feet. This machinery is on a barge 45x35 feet. The engine and machinery cost £4000 and the barge £1500. In order to secure the ground to be worked from floods, it was necessary to construct a dam and flood-race. The latter is over 500 yards long by 40 feet wide, and encloses about 12 acres of the bed of the creek.

The depth of the ground will be from 25 to 30 feet. The wash dirt is raised by the pump 49 feet, and falls into two sluices, each 200 feet long by four feet wide, where it is operated upon in the usual method of sluicing.

The ground selected for present working is near the richest claim that was on the Woolshed, and it is thought that the careless methods of early days—1856—have left behind enough gold and tin to make most profitable the whole of the creek worked by this new process. Other similar plants, are to be put

SECTIONAL VIEW OF DREDGE, SHOWING PLOWS.

for mining, though the official report referred to, speaks of it as being used with good results for dredging gold-bearing deposits in beds of rivers in Australia. The general subject of river dredging for gold is referred to in another article in this number of the Press.

VALUABLE SLIMES.—On Nov. 3, a notice was served on the Hale and Norcross, Savage, and Chollar mining companies, instructing them to take possession of the slimes impounded in reservoirs, and claimed by the mill rings of the Comstock. Refusal or neglect to comply with this notice will compel the stockholder (M. W. Fox) to institute an action in behalf of the corporation for the recovery of all these valuable alluvies, assaying from \$50 to \$150 per ton.

THE NEW ARTIFICIAL QUININE, produced by Messrs. Grimaux and Armand of Paris, is mentioned as one of the great discoveries of the year. It is obtained by treating the base anprein of a Brazilian shrub with sodium, then treating the resulting compound with chloride of methyl. The product is quinine absolutely identical with the substance that has become so familiar and so indispensable.

At the Crescent mine, near Greenville, Plumas Co., ten shots had been put in by two Italian miners, when they gave the signal to hoist them on the bucket. When about 10 feet up, three blasts went off and one man fell to the

SMALL VON SCHMIDT PATENT SUCTION DREDGE, FOR DREDGING GOLD-BEARING DEPOSITS IN BEDS OF RIVERS, ON BEACHES, ETC.

PLAN OF DREDGING MACHINERY ON BARGE.

up if this proves unsuccessful. They expect to lift and wash a cubic yard a minute for 3d, whereas the same quantity handled by manual labor in the old way cost 1s 6d.

Similar machinery (Von Schmidt's patent) is being used with good results at Yackandandah,

and plans of this are given in the accompanying cuts. These cuts, and these remarks, are taken from the last official report of the Secretary of Mines for Victoria. The Von Schmidt suction dredge is a California patent, and has been for years working in Oakland harbor and

other places dredging mud and depositing it at a distance. The revolving plow cuts away the mud, which is sucked up with quantities of water by the suction pump, and thence passed through a long pipe to point of deposit. It has not to our knowledge been used in this State

ground. After he reached bottom, the other seven shots went off, yet he was not killed, though badly hurt.

SOME ore containing a little silver and a trace of gold has been struck near New Almaden.

BRYAN'S ROLLER QUARTZ MILL.

NEW COMMON SENSE STEEL WHIM.

ALL COMPLETE FOR \$150.

NO COG WHEELS OR CLUTCHES TO BREAK. Ninety per cent of this whim is wrought iron and steel, and will spring or bend before breaking, and besides can be repaired at any blacksmith shop, should breakage occur, thus obviating the necessity of sending away hundreds of miles sometimes, and waiting a week for repairs. THE BRAKE SETS ITSELF WHEN THE HORSE STOPS OR ANYTHING GIVES WAY.

It can be packed anywhere a jack can go, the heaviest piece weighing but 100 pounds; total weight, 650 pounds. The sweep can be thrown out or in gear at any time, and the bucket hoisted, dumped or lowered while the horse is in motion. It is just as safe and reliable as an engine, and can be handled as readily, and is just the thing to open up a mine and make it pay. Spending thousands of dollars in fine machinery and shaft houses has "busted" many a company. Buy a COMMON SENSE WHIM, and when you have got more ore than our Whim will hoist, then it is time to buy an engine, not before. It will save you thousands of dollars if your mine should not pay. Being all iron except the sweep, it will not rot, warp, twist, or get out of true. Being wrought iron, it will not break in transportation.

We also make TWO, FOUR AND EIGHT-HORSE POWER WHIMS, DERRICK WHIMS, and BUILDING HOISTS, ORE BUCKETS, and everything pertaining to Horse Power Hoisting. State for what purpose, and at what place you want to use it.

Come and see one at our works in operation, or send for circular.

Secretary Foster on Silver.

On Wednesday, November 11th, the American Bankers' Association, representing a membership of 1993, met at New Orleans, at which a letter was read from Hon. Chas. Foster, Secretary of the Treasury, on the present status of the silver situation in this country. In his letter the Secretary states that the amount of silver bullion purchased with treasury notes, under the provisions of the new law, from August 13, 1890, to November 1, 1891, has aggregated 66,588,536 fine ounces, costing \$68,626,585, an average cost of \$1.03 per fine ounce. From this silver \$27,848,475 has been coined, and the remainder is stored, in the shape of fine bars, in the vaults of the Mints as a reserve against the treasury notes outstanding. The Secretary, while claiming that the amount of money in circulation is greater per capita than in any other country except France, yet with the growing requirements of this country we can readily absorb the money put out through the annual monthly purchases of silver.

Toward the close of his letter, Secretary Foster says:

It is claimed by those conversant with the production and movement of silver that when the visible stock upon our market is disposed of, the monthly absorption of 4,500,000 ounces of silver by this Government will have a tendency to effectually and permanently steady the price of that metal. If the monetization of silver as full legal tender is ever to be accomplished, it can only be done by the action of nations of sufficient commercial importance to maintain some fixed ratio in the coinage between the two metals. The new Silver Act is an important step in that direction—(1) because compulsory coinage and the issue of silver dollars of less intrinsic value than their nominal value, is repealed; (2) because it provides for a much larger absorption of silver by this country than heretofore, for currency purposes, and (3) because the new law declares it an established policy of the United States to maintain the two metals at a parity with each other.

How Much Longer.—The smelting plant is a success. It is no longer theoretical only; it is practical. All day long and all night the rock and coal are going down into the fire and streams of red-hot slag and metal run into the receptacles that await them. During each period of 24 hours a hundred tons of ore go into the furnace mouth; and during the same period, 15 tons of silver-lead bullion run into the lead wells. One large enterprise is already on a paying basis, notwithstanding the lack of railways to connect us with the world. How much longer can the haterings and hickerings and jibes of railway men prevent the whole of Southern Nevada from being awakened into life? When competing railways, or a single line that will give us decent rates, connect us with tide water, a hundred such enterprises as that which has just struggled into a successful position, will spring into existence. The steam whistles of hoisting and reduction works will resound in every range of hills. Thousands of acres will be tilled to hundreds that are now in use, and a hundred thousand prosperous people will inhabit a wonderfully wealthy land now almost unknown. —*Pioche (Nev.) Record.*

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vibration and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffls also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

ELECTRIC BLASTING.

VICTOR ELECTRIC PLATINUM FUSES.
Superior to all others for exploding any make of dynamite or blasting powder. Each fuse folded separately and packed in neat paper boxes of 50 each. All tested and warranted. Single and double strength, with any length of wires.

VICTOR BLASTING MACHINE. Made in two sizes. No. 2 fires 20 to 30 holes. No. 1 fires 5 to 8 holes. Adapted for prospecting, stump blasting, quarry and general railroad work.

"PULL UP" BLASTING MACHINE.—The strongest and most powerful machine ever made for Electric Blasting. No. 4 size fires 70 holes. No. 3 size fires 40 holes. Are especially adapted for submarine blasting on a large mining work.

Standard Electric Fuse and Blast Tester, Wire Reel, new design, Leading and Connecting Wire.

Some New and Valuable TECHNICAL BOOKS.

LANGBEIN.—A COMPLETE TREATISE ON THE ELECTRO-DEPOSITION OF METALS.

Comprising Electro-Plating and Galvanoplastic Operations, the Deposition of Metals by the Contact and Immersion Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Descriptions of the Electric Elements, Dynamo-Electric Machines, Thermopiles, and of the Materials and Processes used in every Department of the Art. Translated from the German of Dr. George Langbein, with additions by William T. Brann, Editor of "The Techno-Chemical Receipt Book." Illustrated by 125 engravings. In one volume, 8vo, 404 pages. Price.....\$4.00

BLINN.—A PRACTICAL WORKSHOP COMPANION FOR TIN, SHEET-IRON, AND COPPER-PLATE WORKERS.

Containing rules for describing various kinds of Patterns used by Tin, Sheet-iron and Copper-Plate Workers. Practical Geometry. Mensuration of Surfaces and Solids; Tables of the Weights and Strengths of Metals and other Materials; Tables of Areas and Circumferences of Circles; Composition of Metallic Alloys and Solders, with numerous valuable Receipts and Manipulations for every-day use in the workshop. By Leroy J. Blinn. A new, revised, and enlarged edition, printed from new type, and with 170 newly engraved illustrations. In one volume, 12mo, 296 pages. Price.....\$2.50

EDWARDS.—THE AMERICAN MARINE ENGINEER.

Theoretical and Practical, with Examples of the Latest and Most Approved Marine Practice. For the Use of Marine Engineers and Students. By EMORY EDWARDS, Marine Engineer. Illustrated by 85 engravings. 12mo. 435 pages. Price.....\$2.50

EDWARDS' 600 EXAMINATION QUESTIONS AND ANSWERS.

FOR ENGINEERS AND FIREMEN (Stationary and Marine) who desire to obtain a U. S. Government or State License. By EMORY EDWARDS. Full bound in pocket book form, leather. 180 pages. Price.....\$1.50

Send the above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

A circular giving the full Table of Contents of each of the above books, will be sent free of postage to any one in any part of the world who will furnish his address.

Our New and Enlarged Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

EVERETTE'S MINING OFFICE.

Pioneer Mining Office of the Northwest
Coast.

Having the largest permanent brick assay furnaces, chem-
ical laboratory and mining office on the Northwest Coast;
with a collection of about 4000 samples of the ores of Alaska,
British Columbia, Oregon and the Northwest Territories,
and having made personal examinations of nearly every
mining camp on the Pacific Slope, from California to
Alaska, I am prepared to do any class of legitimate and
honest mining work, such as EXAMINING, ENGINEER-
ING, SAMPLING AND REPORTING ON THE VALUE
OF ALL MINERAL COAL, AND FIRE-CLAY PRO-
PERTIES, BUILDING STONES, EARTHES, ASSAYS
AND ANALYSIS OF ORES, WATERS, ORECK,
SAMPLES OF ORE, PULPS, "ORGANIC ANALYSIS"
WORK, and in fact any work connected with the office of a
first-class mining geologist and chemist. Any information
mining men may desire to know relative to the MINERAL
OR COAL RESOURCES of the entire Pacific Northwest
will be honestly given. Address **DR. WILLIS E. EVERETTE**,

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1 SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores of the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scoriification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth. 1889. Price, \$1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc. Price \$1.75.

This hook is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & Co. Publishers, No. 220 Market St., S. F.

C. H. EVANS & CO.

Pumping Engine

(CONDENSING) Capacity, 1,000,000 gallons daily; steam end, 18 1/2 x 29, plungers, 8 1/2 x 18-inch stroke; nearly new. For further particulars, apply to Room 20 331 Pine St., San Francisco.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Nov. 12, 1891.
General trade continues fairly active, although in some branches it is reported dull. The money market is fairly active, with the commercial banks reporting a good inquiry for funds. The savings banks report large holdings. Interior advices continue to report money fairly easy, with, in some localities, holders seeking investment. The Eastern money centers report many generally active, with a fair degree of ease reported. The importation of gold from abroad aids in the general ease. European mail advices indicate a growing stringency in the money centers, owing to the outward flow of gold. The Russian loan and the heavy importation of cereals are the two prime factors in creating the stringency.

In remarking on the money situation East, a correspondent writes as follows: "The conditions are all favorable. The crops are large and safe; they are bringing good prices, with a demand beyond the most sanguine expectations. The only mistake appears to have been in expecting to find the money in circulation too quickly. The trust and loan companies are beginning to get a good deal of their money back, but it has not had time to be reinvested. The railroads are earning a great deal more money than in previous years, but their floating debts are larger, and before they can spare anything for equipments and renewals, old scores have to be settled, and so on all the way through. In some parts of the country, a good deal of liquidation has been going on among mercantile and manufacturing establishments, so that the period for expansion has barely been felt as yet. Business is in a perfectly healthy condition, nevertheless, and while there is nothing to indicate much, if any, improvement this year, it will probably develop very rapidly during 1892."

MEXICAN DOLLARS—The market continues easy at around 74 1/2 cts. One large institution holds considerable cash cost over 76 cts.

QUICKSILVER—Receipts the past week aggregate 342 flasks. With the different mines' output pooled, quotations are more stable. The demand is fair.

SILVER—The market continues to fluctuate. It is very difficult to get at the bottom of the present situation both at home and abroad, but it looks as if there is a strong under-current to place the metal in all civilized countries on a more even footing with gold. The growing scarcity of the latter metal and the increasing requirements for commercial purposes are likely to force silver to the front.

IRON—Imports the past week aggregate as follows: Sutherland, 600 tons; Hull, 100; Liverpool, 300. Total, 1000 tons. The market is reported fairly firm at quoted rates. The imports of the week are said to have been provided for previous to receipt. The consumption is quite large and steadily increasing. Eastern mail advices continue to note low prices, with Southern furnaces supplying the bulk. It is generally conceded that prices cannot go any lower, and with any increase in the demand, better prices will obtain. English advices report a steady market.

COPPER—The market appears for the present, at least, to have touched bottom. New York mail advices to Nov. 5th, report as follows: "That consumers are inclined to purchase with greater freedom is not clear and the condition of the market for manufactured goods is not wholly assuring for any decided improvement in the immediate future. Shipments to Europe are still on a liberal scale, but new orders are unimportant, and no great relief is likely to come from that quarter. There has been some inquiry suggestive of speculative interest, but the latter appears to be confined within the metal trade proper and apparently engineered for effect. Offers were said to have been made of 1 1/4 cts on upward of 1,000,000 pounds of Lake Superior iron for delivery this year and 1 1/2 cts on smaller quantities." London cables to *Iron Age* of Nov. 5th, are essentially unchanged from those given in our last week's issue.

TIN—The local market is lifeless for both plate and bars, with quotations more or less nominal. Eastern and European advices report an unsettled market, with buyers favored, owing to larger available supplies.

LEAD—The market is barely steady at quotations. The St. Louis market is reported in a demoralized condition, and while prices are lower, yet there are those who look for a still lower range.

COKE—Imports the past week are as follows: London, 2000 tons; Swansea, 90; Sutherland, 340; Hull, 199. Total, 4420 tons. The market is well supplied and quotations barely sustained.

BORAX—Receipts the past week aggregate 420 casks. The market is strong at pool prices.

ANTIMONY—The market is firm. Eastern advices report supplies at home and abroad well under control.

COAL—Imports the past week are as follows: Greenock, 3235 tons; Departure Bay, 7130; Hull, 1089; Coos Bay, 470; Tacoma, 6000; Swansea, 4687; Seattle, 957; Liverpool, 1798; Newcastle, N. S. W., 18,685; Comox, 4500; total, 60,826 tons. The above are the largest imports within any one week for several months past. The spot market is oversupplied, with buyers favored. The scarcity of yard room is against both spot and near by cargoes. The consumption, although large is not up to expectation, owing to the absence of cold weather, and consequently, a light demand for household purposes. Cargoes for shipment are strong, owing to the firm views of ships from supply ports.

Eastern Metal Markets.

By Telegraph.

New York, November 11.—The following are the closing prices the past week:

	Silver in	Silver in	Copper.	Lead.	Tin.
Thursday	43 1/2	94 1/2	11 50	4 10	19 90
Friday	43 1/2	94 1/2	11 40	4 10	19 80
Saturday	43 1/2	94 1/2	11 40	4 10	19 80
Sunday	43 1/2	94 1/2	11 40	4 10	19 80
Monday	43 13 1/2	95 1/2	11 35	4 10	19 65
Tuesday	43 1/2	95 1/2	11 35	4 10	19 75
Wednesday	43 13 1/2	94 1/2	11 35	4 10	19 80

Quicksilver is strong at full figures. Iron is in good demand. Borax is steady at pool prices. Tin is barely steady. Lead is weak and unsettled. Copper is steady at lower quotations.

Mining Share Market.

The mining share market showed considerable activity the past week and at better prices. While many of the reported sales were unquestionably cross-orders, yet there were a fair percentage of genuine transactions. The principal advance was in the shares of the Gold Hill, Devil Gate and Middle group of mines. Quotations through cross-orders for the shares had been brought down to about as low figures as they usually touch, even when the mines did not show so well. The managements have been prospecting to the west on several levels, and reliable advices confirm the finding of rich ore, and to get more stock was undertaken by breaking the market through cross-orders and assessments. Their endeavors, to a large extent, were crowned with success. It was their purpose to sink quotations to still lower figures, so as to get still more shares, and which they would have done had it not been for the course of this paper in publishing the true situation of the stock market, the condition of the mines and the purpose of the pool. Outsiders must not forget that in operating in stocks they are playing against great odds and that a good profit in sight is like a bird in hand, worth two behind the bush. While there has been a good advance in the market, some of the stocks nearly doubling in value, yet it looks as if still better prices will obtain, but how much, each person must be the judge. If prices run up to figures beyond what the situation at the mines warrants, then it is safe to say that the shares are a sell, for when top prices are reached another strong depression, with low prices, to be followed by assessments, will set in. At this writing there is nothing to warrant the conclusion that top prices have been reached, but everything to justify the assertion that many of the stocks have hardly commenced an upward move.

In outside shares, there has been more activity in Bodie, but the Quijotas and Tuscaroras have hung lifeless.

The Chollar, Savage, and Hale and Norcross Mining Companies have been notified by a stockholder (M. W. Fox) to take possession of the slimes, etc., for the benefit of shareholders. If this notification be ignored, then measures will be taken to see that it be done. As the slimes, etc., assay from \$50 to \$150 per ton, and there are thousands of tons, it will be quite a nest-egg for shareholders.

It now looks as if the days of the mill rings on the Comstock lode are numbered, and when they become a part of the past, then we can look for a real, genuine stock deal in mining shares, with outside capital invested. It is the general opinion that the rings getting away with the bullion, while outside shareholders get left with assessments on their hands, has killed the goose which laid the golden egg. Even after a reformation starts in, it will probably be some time before outside capitalists enter the market.

It is thought that it would serve the rings right, now that they have many of the mines in good condition for looting, if they could be compelled to work them honestly and for the benefit of shareholders, and not for a limited few boddlers, so that dividends, and not assessments, be in order.

According to the reports of the superintendent of the Hale & Norcross Company, the ore taken out of the mine for the years 1888 and 1889 and the first half of 1890 assayed in value about \$3,500,000, which, had they milled in the same manner as was the ore in the bonanza days, would have yielded in bullion fully \$3,150,000, which would have paid many dividends; but instead, only one dividend (\$108,000) was paid, while several assessments were collected.

On next Monday, the suit of M. W. Fox vs Hale and Norcross Mining Co. (an incorporation) and the different directors who have served, continuously or otherwise, since 1886 will come up for trial before Judge Hebbard, and if the defendants do not succeed in securing another postponement, it will be tried to a finish. It is openly asserted that this suit will show stockholders how the mine has been looted. It is said that full details will be given, from the electing of dummy directors by aid of proxies given by brokers who do not own the stock they vote, until the ore is handed over to the mill ring. Evidence, it is claimed, will also be given, systematically trading the bullion to the assay office, from thence to the United States Mint, and the proceeds into the treasury of the company and into the pockets of the mill ring. If the plaintiff proves what he says he can, then stockholders will be able to see that they always get crow while the mill ring gets turkey.

Mining shares opened this (Thursday) morning generally weak. After regular call, prices went off slightly, but toward the close a stronger tone was noted, but with no higher prices quoted. The general feeling is bearish, and the present move is only made to allow a large operator to get out of his stock and at the same time collect assessments.

News from the Comstock mines continues uniformly good. If the writer is not mistaken, the character of the work in several of the mines looks as if it will be several months before the pool can or will show up much ore on which to have a large-sized deal. The prospecting and developing work is being done on an unexampled large scale, and when the time does arrive to show ore, we can reasonably look for the best of results, provided the mines are worked according to the mining laws of California. While the work is under way active times are not at all improbable, and higher prices reached for shares; yet while saying this, it is not at all unlikely but lower prices will be touched before the big deal sets in. Many well-informed operators take this view, and heretofore they have been right. They reason that an upward move before a holiday means lower prices afterward, but a weak, dragging market before a holiday means higher prices afterward. But then this rule may not be infallible. In Mexico they are sinking a compartment shaft. It is claimed that it is sunk so as to intercept the 1800-foot Con. Virginia north drift so as to get air and admit of more thorough developing work in Con. Virginia, Ophir and Mexican. In sinking the shaft, they are liable to strike ore of more or less width and of more or less value, which will admit of making a gambling move similar to what was done in sinking the winze in Overman and again in Potosi. They ought to be in ore soon on the 1800-foot level in Con. Virginia. In the middle mines, active developing work is still the order. In the Gold Hill

MINING SHAREHOLDERS' DIRECTORY.

group they will soon be able (about January) to commence active work to develop the ore below what is known as the water level. More active work is under way in the Alta group.

From the outside mines our advices report more men put on in the Quijotas mines, and that they will start up soon. In Silver King, active developing work is under way and ore is being taken out for milling. The Tuscarora mines continue to look well. They are shipping ore to Salt Lake for reduction. From the Bodies, encouraging news continues to come to hand.

OFFICE OF THE

Mining and Scientific Press

Pacific Rural Press

No 220 Market St.

TAKE ELEVATOR NO 12 FRONT ST.

SAN FRANCISCO, CAL.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.
143 LIBERTY STREET, NEW YORK, U. S. A.

PELTON WATER MOTORS, Varying from the fraction of 1 up to 40 and 50-horse power, unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above.

THE GATES ORE AND ROCK BREAKER.

UNLIMITED IN CAPACITY. UNEQUALED IN EFFICIENCY, UPWARD OF 3,000 NOW IN USE. Will do more than twice the work of any other with the same cost in wear. Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without any additional expense. THE BEST AND ONLY CRUSHER ADAPTED TO MACADAM ROAD WORK. Send for Circular.

It having come to the notice of the undersigned that their patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted. (Signed) THE PELTON WATER WHEEL CO.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880

September 18, 1883; July 24, 1888;

and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

Price of Improved Belt Frue Vanner, \$825, f. o. b.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.

Price "Triumph" Concentrators, with Plain Belt - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

GRASS VALLEY, NEVADA CO., CAL., NOV. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

CERTIFICATE—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrator is the equal, if not superior to any other style of Vanners or concentrating devices.

Signed] Sup't North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES

For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER AT REDUCED PRICES.

Our plates are guaranteed, and by actual experience are proved, the best in weight of Silver and durability. Old Mining Plates Replated, Bought, or Gold Separated. THOUSANDS OF ORDERS FILLED.

SAN FRANCISCO NOVELTY, GOLD, SILVER AND NICKEL PLATING WORKS,

Electric Locomotives.

While electricity had been used for some time in mining work, for the purpose of lighting mines, it attained no prominence in the field of underground haulage until the Thomson-Houston Electric Company designed and installed in the Erie Colliery of the Hillside Coal Co. the first successful electric mining locomotive of the country. This was in October, 1889.

Requirements of other mines, however, has led to the production of a locomotive differing essentially from that in the Erie Colliery, a type known as the "Terrapin Back," and which is shown in the accompanying illustration.

It is most substantially and solidly built, the interior mechanism being entirely protected by a heavy iron armor, and possesses in a marked degree the important features of strength and solidity. The motor for operating the locomotive is of the iron-clad consequent-pole type having a Gramme-ring armature.

It is provided with the radial type carbon brushes and elongated commutator segments, by means of which the most durable connection with the armature coils is obtained. The motor is situated midway between the axles, the proper speed reduction being attained by means of a train of gears. The locomotives can be run at various speeds, the motors being wound for any speed as a maximum from 4 to 10 miles an hour.

The locomotive is provided with the necessary controlling devices, all placed within easy reach of the operator.

A special type of rheostat, composed entirely of mica and German silver is employed, and a new and improved brake lever and reversing switch. The trolley arm, through which the current is conveyed to the motor is of the double-elbow pattern, which accommodates itself automatically to the varying heights of the conductor and permits the operation of the car in either direction. On each side of the locomotive is placed an incandescent lamp, which serves the double purpose of signal and headlight. A 220-volt generator supplies the necessary current.

The Thomson Van Depoele Electric Mining Co., which designed this locomotive, has also

THOMSON VAN DEPOELE ELECTRIC MINING COMPANY'S "TERRAPIN BACK" MINING LOCOMOTIVE.

in process of construction several new types suited to the requirements of different mines, hard and soft coal, iron and other metals, and for high and low entries and for gauges, varying from 18 inches to the standard. The company having had such valuable experience in the field of underground electric haulage, is particularly fitted to design and manufacture any locomotive of any type demanded by local conditions. The success of the apparatus already installed has given great impetus to this branch of applied electricity and will result in the still further use of electricity in mining operations.

SOME Californians are talking of taking hold of the tin prospects at Dorango, Mexico.

Electric Hoists.

For hoisting purposes by electricity there is a variety of forms and sizes from a three-horse whip, for hoisting small buckets, to a machine capable of operating a full sized cage under its maximum load. Two cuts on this page (from Mr. Spaulding's paper on "Electric Power Transmission in Mining Operations") show different views of a line of electric hoists lately put upon the market for miscellaneous uses and ranging from 10 to 80 horse power.

THE WELLINGTON STRIKE OFF.—The news

from Nanaimo that the Wellington coal miners have, after a battle of 17 months' duration, declared their strike off was received with a great deal of satisfaction among the trade unionists in this city, who, although they would rather hear of victory than defeat, are glad the long and costly fight is over. The unions in this city have gone to much trouble and expense during the coal strike, and have given much assistance to the striking miners both by contributing money and by actively boycotting the fuel from the interdicted mines. The end of the trouble, therefore, is a great relief to them.

Mines About Kernville.

(Written for the Press by STEPHEN BARTON.)

Of the mines heretofore producing bullion in this locality most all are at a drag. The Russian Bear, at Glenn Olive, which one year ago, stood at the head, as a bullion producer, has been shut down and the machinery moved away, though I understand the principal owner has ordered a resurvey of the mine.

A couple of years ago a Los Angeles company hounded a new mine, south of here, called the Pine Tree. At the instance of this company, Mr. James Burton was induced to undertake certain development work, and at the expiration of the bond, found he had to look to a miner's and material man's lien for his pay. The matter went into court, and he ultimately received a sheriff's title. Some two months ago, he went to do the assessment work for the year, and erected a horse arrastra on the mine, where he has ample power for a Pelton wheel. He made a test run with a result of \$23 per ton. To say he was elated would be drawing it mild, as he has several hundred tons of rock mined on the chimney and in the slopes, of which this is regarded as a fair sample, and which can be reduced by arrastra process for \$7 per ton; besides, the lode has never been excelled for size by but two or three in this portion of the State.

The Finding of the Lost Ship Mine

Is creating some comment here. I think Capt. J. W. A. Wright was a correspondent of the Press, some 12 years ago, and wrote up the legends of the Ship mine, so far as could be ascertained. Ship was accustomed to bring to Visalia dust and fine specimens and claimed they were from a mine shown him by his faithful squaw. On one occasion he came to Visalia for the purpose, as is alleged, of making arrangements for a mill. As usual he got on a drunk, and as usual, undertook to resist arrest, while disturbing the peace. Next morning, Ship was hurried without any one but the squaw knowing the location of the mine. He lived north of Visalia, and many thought the mine was north of King's river. It is now claimed that the mine has been found on the desert, east of the Sierras, and if so, of course, his most feasible route would have been up King's river, and through the Kearsarge pass.

The story of the finding of the mine runs like this: After the death of Ship, it is claimed that the squaw went to the vicinity of the mine and took up with a leading stockman by the name of Prewett; that she showed Prewett the mine; but he, having no taste for mining, kept the thing a secret for 17 years. He then, for satisfactory reasons, showed the mine to David and Luther Burton. One thing is certain, the boys have just returned from opening the mine, and bring rich specimens of honeycombed quartz, highly impregnated with oxide of iron and well bespangled with fine gold. They claim the ledge to be eight feet wide, and in part silver-bearing, though for long distances the gold rock nearly crowds out the silver.

Indications of Tin.

There is some suspicion of a discovery of tin here. The ore fills the fissure-like trap, without any other matrix; has much the appearance of black oxide of manganese—black, very hard, fine-grained fracture, very heavy, patches in the black merging into brown, with a red streak in the center of the brown, which soils the fingers a bright red, but not a cinnamon red. It is claimed by the finders that with carbonate of soda, in a crucible at a white heat, it yielded many globules of a soft white metal, some the size of a pea. A specimen sent to the city was reported on as being sandstone and iron. This would be about as clear as to declare that it was not purified rock. One of the rocks is gray granite, the other is diorite merging into greenstone.

An Old Mine Rediscovered.

EDITORS PRESS:—Hearing that the old Mission gold mine had been rediscovered, your correspondent decided to investigate.

It has been known for a good many years that the Mission Fathers had a very rich mine somewhere in this part of the country, and until lately all efforts to find the same have failed. Within the last few weeks certain parties obtained information in relation to the situation of the old works, and the place that they are now working tallies with the description given. The story goes that when the Americans came into the country, the Fathers had the old shaft covered with heavy timbers, and over that the surface soil. The shaft was said to be about 20 feet deep, with a drift leading from that. Mr. Hartley is in charge, and gave what information he could.

The ground they have been working over is evidently the dump of the old mine. The vein has been laid bare about 40x50 feet. Mr. Hartley says that this particular part of the vein is a blow-out. The quartz shows signs of having been burnt slag, etc.

The quartz from the vein assays at \$20 per ton, and a specimen piece from the dump went over \$1000. The old shaft is being anxiously

looked for, as the discovery of that will settle the question, so it is thought.

The land is on the Cajon grant and belongs to H. P. McKoon, who has rented it to the parties interested. If anything further is found, I will report. ROBT. H. ASHER.
El Cajon, Nov. 5th.

An Immense Deposit of Ore.

EDITORS PRESS:—In the Santa Rita mountains lies one of the largest bodies of ore in the southern part of the Territory of Arizona. It is unknown by the outside world, but in future will be one of the best known properties in the "West."

It is at the base of the mountain known as "Signal Peak," next to the highest peak in Southern Arizona, which towers above it 400 feet.

The tunnel is 200 feet, running east and west, and of this 130 feet in ore and ore still in face. Eighty feet from mouth of tunnel is a crosscut in 60 feet, and all in ore, and the same at the face of tunnel. It is one mountain of iron pyrites ore. The assays run from \$3.10 in gold and \$2 in silver up to \$3 in gold, \$26 in silver. It is known as the Arkanian, owned by Wm. T. Powers, a mining man of this place, and one other party.

On account of it being such an immense body of ore, and of such a character, I trust it will be of interest to your readers. The formation is lime and porphyry, and the only ore of the kind in the vicinity. CRITTENDEN.

Reduction Works.

While the present boom of north and south railroad talk is at its height, the Prescott (A. T.) Courier wishes to gently say something about a matter of more vital interest to this section than railroads, and that is the erection of complete reduction works in this vicinity. Here we have the largest area of continuous mineral country known, the extent of which is only equaled by the number and richness of its mines. For twenty odd years a steadily increasing stream of ore and concentrates has been pouring out of this section to foreign smelters, while thousands upon thousands of tons of rich ore, but not rich enough to ship, have been left lying upon the dumps, which might be worked if we had complete works for the treatment of ore here at home. Why is this? Why is it that a purely mining country has no great custom mill for the treatment of the product of the country? Some who know a great deal more about ore than the Courier look wise and assert that we have not enough ore to support such works. While very few will agree with them, for the sake of argument, suppose we do. How long would the great smelting works at Omaha, Denver, Pueblo, El Paso and other places run if they were dependent entirely upon local output of ore, or even that of the particular States or Territories in which they happen to be located? We have oceans of ore to start on, and what has been done elsewhere can be done here. Suppose a lot of men should circulate around in Lowell, Mass., and talk against cotton mills, using arguments such as this: "Why, a cotton mill won't pay here; we have not enough cotton. There is not a single cotton plant in the State. In fact, you will have to transport all the cotton you handle nearly 1000 miles."

The argument sounds plausible enough, but it don't hold water, for the energetic New Englander has been running cotton mills a thousand miles from the cotton fields for years, and doing it successfully, too. We are in the same boat with the southerner, who for years studied how to concentrate his cotton into little bales so that he could ship it a thousand miles to have it treated, only we concentrate ore instead of cotton. For generation after generation the southerners concentrated their cotton and shipped it when it could have been worked on the ground to much greater advantage. Why did they do this? They did it because there were no energetic spirits to grasp the situation, because there was a lack of concert of action for the common good, and because there were wise men who said, "We haven't proper kind of labor," and so on. And so it went, until the fellows who treated cotton a thousand miles from its source got crowded, and some of them moved down to the cotton fields and astonished the natives by the greatness of the undertakings they carried through; and so it has been with us and our ore.

The time will come, of course, when some moneyed men will erect reduction works here, because they have been crowded out, and because ore shipping communities commence to treat ores at home. But what is the use of waiting for this good result until the third or fourth generation? Let us try and have reduction works in this generation. Don't let us confuse the workmen on the north and south railroad by too much railroad talk; let us give them a rest, and agitate the reduction works' proposition. Now is the time to build reduction works, and Banning creek, one mile south of Prescott, is the place.

A ROUND MILLION.—The California Electric Light Co. of this city has sold its plant to the Edison Light and power Company for \$1,000,000, represented by 10,000 shares of stock of \$100 each. This conveyance is subject to a mortgage of \$300,000, held by the California Safety and Trust Company.

Looking for Tin.

Methods of Testing Float and Croppings.

For many years the general supposition has been that there is no tin ore in America, and I believe that the Government at one time offered a large reward for the discovery of that ore in this country, writes a contributor to the Denver News. I do not know whether the reward has ever been claimed or not, but I do know that there is tin ore in various places in the Western States and Territories, and the time is not far distant, in my judgment, when tin in abundance will be produced here, not only to supply our own wants in that line, but enough to supply foreign lands, and thereby keep at home about \$30,000,000 annually, that is now sent abroad for that metal alone in its various shapes.

As there is now a very strong inducement for miners to prospect for it, I want to give a few pointers as to where and how to look for the ore, and how to know it when they do find it.

Where Tin is Found.

There are several facts to bear in mind connected with tin ore. Tin is never found in its metallic state; at least our best authorities on the subject claim that a pure tin crystal is the nearest approach to pure crystal that has ever been found. A pure crystal runs 78.4-10 per cent metallic tin. This is known as cassiterite by its scientific name, but it is simply the oxide of tin.

What is known as stream tin, are pieces of crystal broken off by the action of the elements from the crystal of the tin in the vein or lode, and have been worked down the gulches and streams below the lodes, for thousands of years past. This stream tin is found in all beds of alluvial gravel that lie between the veins of ore and is obtained by mining precisely like placer mining. In every pan of dirt washed in the tin district in the Black Hills, there is more or less of the stream tin along with the placer gold.

A great many miners throw this away as of no use, thinking it is iron. In some instances it is pure iron, but if you find these little nuggets below a lode or vein where you know there is mica, save all of them you get hold of and test them for tin, and in most cases you will get a good assay of that metal.

Tin ore in America is almost invariably associated with mica, and mica is found in the granite formation in a true fissure vein that carries a white or cream-colored spar, or what is known as alabite, frequently a stratum of crystallized quartz in the same vein, and in all of my many years of experience in searching for tin ore, I have never found any other ore or metal in the vein, except in one instance in the Black Hills. Then I found gold in the quartz that was imbedded in the spar. The spar contained the mica and oxide of tin, and nothing else.

In nearly every instance, the mica is found in hooks, and these hooks range in thickness from half an inch to three inches, and are lying in every conceivable shape you can think of except a horizontal position. At the bottom end of the hook, you find a piece of ore which you will at once pronounce an iron ore and of no account, but defer your judgment awhile; it may be iron and sometimes is iron, but in most cases it is an impure tin crystal.

How to Test It.

Now, then, you need to test it. If you think it is a tin crystal, take a pound or two and pulverize it as fine as it is possible to get it (you cannot get it too fine), then pan it out until the water is clear, and you will find a heavy powder where you would find the gold if hunting for that metal; but as you are after tin, you work a little differently.

This powder (if it is the oxide of tin, as you think it may be) will be one of five different colors. It may be a light or dark brown, a steel gray or a blue black in color. After you get this far with it, unless you are a fully competent assayer, dry the powder, send it to the best assayer you know of or call for an assay for tin, send him a \$5 bill, and if it is tin it is worth ten times that amount.

In some of the veins or lodes I speak of, there are tourmaline crystals and tungstate of iron in nuggets. Neither one of these is of any account whatever. The tourmaline crystal may be a six or eight-sided crystal, and of a brilliant jet-black color, very pretty to look at, but that is all they are good for. The tungstate of iron is of a dull gray color, bordering on black, and very heavy, but of not much use.

Whenever you find the mica in hooks, you will generally find the tin crystals with them or close to the hook in the spar in small minute crystals; but when you find the mica small and not in a hook form, you will find the oxide all through the vein, and although the spar may look to be pure white in color, take a glass and examine it closely and you will find very fine black specks all peppered over it, and so very fine as to be invisible to the eye without a good glass. After you detect the specks in the spar, pulverize a few pounds of it and pan it out down as low as you can to a fine powder of one of the colors I mention. That powder is an oxide of tin.

Back Hills Ore.

In some of the lodes of tin ore in the Black Hills, the oxide is disseminated throughout the spar, from wall to wall, so thickly as to make the spar look like a white granite. These veins are generally the richest in tin, and I know of veins there of this character that are 20 feet

thick and run from 10 to 15 per cent in metallic tin.

I have even assayed the granite wall rock on such veins, and found one to three per cent of tin in the granite at a depth of three inches from the gangue matter in the vein or lode. This fact proves to my mind at least that the oxide was originally in a metallic state, but by action of intense heat was reduced or rather altered to an oxide, and now has again to be reduced to metal by proper methods.

It will not do to say there is no tin in America. I have found tin during the past six years in the Black Hills of Dakota, and there is enough there to supply the world for ages to come, and in Wyoming, Utah, Montana, Nevada, Colorado, New Mexico and in Arizona, and I believe in the near future tin will be found in large quantity in all of these places. It only requires a careful examination of all the veins of spar in the granite formation that carries mica in the spar in any of these States I have mentioned to find tin ore. In so far as my own experience convinces me in the matter, there is no use to look for it in any other formation except the granite or where the micaeous slate and granite are together in place. There may be and often are other metals to be found in true fissure veins in these formations, but where the mica is found in the spar, either in hook form or in small particles, there you may very reasonably expect to find tin ore.

Mining with Snow Water.

R. K. Dalton of Montpelier, Vt., was one of a party of three New Englanders who were hunting in the Selkirk mountains, in British Columbia, last month. He left his companions in Tacoma and is returning home by way of San Francisco. When seen at the Russ House, in this city, he said:

"The most singular thing that I saw in the Selkirk mountains was the mining camp of two young Americans who were perched up near the snow line on one of the highest peaks. There are a few placer mines in that part of the range and these men had struck dirt, that paid very well, so high up that they could just get their breath and no more. There was no water, but plenty of snow, and the two Americans, Yankees they were, too, had utilized it by building a series of tanks or vats and erecting a steam boiler. How they ever got the boiler up there is more than I can understand, for it must have been hauled some 60 miles from the railroad station and over the rockiest and most precipitous path I ever saw. Steam pipes from the boiler went through the tanks and melted the snow the men packed in them. After the snow was melted the steam kept the ice from forming in the coldest weather, and the two fellows could work all the year around. The dirt paid splendidly or they would have lost money. There was plenty of gold, both in dust and nuggets. The men were bachelors, and they kept a French woman and her husband there to cook and help in the work. I never before came across so much system under so many difficulties."

Outlook in Butte County.

Supervisor A. E. Anderson, when asked his views with regard to the mining outlook in Butte, said: "The outlook is very bright, prosperous and flattering. All over the county in the mining sections the gravel deposits are being worked, and the returns are satisfactory. This is especially true of the northern part of the county in the regions about Magalia, Brown's Ravine and Gravel Range, and the mines being opened there are rich and permanent. These mines are mostly the old channels or the channels of old streams now covered with lava from 10 to 100 feet deep. They are as well defined as the ravines and creeks of the present day and they are rich in gold. Near Forthweston I have been at work a number of years developing a mine that I am convinced will pay well when the gravel is reached. I am now in 500 feet with the main tunnel, and expect to run from 80 to 100 feet farther. The channel I hope to strike is one of the ancient river beds and is under fully 100 feet of lava caps."

As you know, the quartz mining about Forthweston never looked as well nor was as prosperous as at present. I think the mines there are very permanent and will continue to be worked for many years. The success of these mines is encouraging people to invest and do a good deal of prospecting. Dodson & Co., at Mooreville, are rigging up for drift mining. Perkins, Higgins and others, near the Middle Fork, and Wheeler & Co., near Cascade, are among some of the best known gravel miners in our section of Butte."—Oreville Register.

THE LIDGERWOOD MANUFACTURING Co., New York, have secured the services of the widely-known house of Frazer & Chalmers to represent them in Utah, Montana and Idaho. Parties located in that section of the country, desiring to purchase machinery for all sorts of hoisting purposes, will find it advantageous to deal with Messrs. Frazer and Chalmers. Their reputation in the business world is indeed an enviable one, and the improved Lidgerwood Standard hoisting engines, which they will handle, are among the most perfectly constructed machines for the service intended in the market.

The Fruit-Canning Industry.

Among the developing industries of the State, that of hermetically preserved horticultural products ranks foremost. California canned goods are rapidly becoming the favorite in this and other lands. The markets are extending in sphere and in demand, and those engaged in the canning business prognosticate that a few years will see it develop into the leading enterprise of California.

Bright as this vision is, the facts prove it in no way overdrawn in probability. Each recurring season sees a heavier output, and an equally increasing demand, which unmistakably marks an epoch in the expansion of the business. This closing season has been an exceptionally busy one, and the results open a cheering prospect for the future, to both the grower and the merchant. Fruit has been plentiful, and at prices that prove satisfactory to both sides, and still enable the production to be placed in remunerative competition in all markets of the civilized world.

Peaches, apricots and pears comprise the bulk of the fruit put up, and the other fruits come in in proportion to the prolificacy of the crop. Berries of all kinds have been unusually scarce and high-priced, owing probably to the early rains and the demand for green shipment.

It is almost impossible to estimate the exact figures regarding the total number of cases put up this season, owing to the fact that many of the large canneries are still working. But an idea of the enormous amount can be gained from the fact that the Lusk Canning Company alone have already stored for this season upward of 1,000,000 cases of fruits and vegetables. This firm finds its principal consumption in the domestic markets, but also makes proportionally large shipments abroad, in which direction its trade is increasing rapidly.

Owing to the almost total failure of the Eastern crop last year, the demand for California goods was so great that the supply was about exhausted at the opening of this season. This, of course, leaves an exceptionally free market for this season's goods, and the indications are that it will be a long time in the future before the markets will have an opportunity to become overstocked.

Local merchants are of the opinion that there exists immense possibilities for the extension of the trade to India and Southern Africa. The present drawback to such an experiment seems to be a lack of adequate transportation facilities, but this they hope will be speedily overcome with anticipated new enterprises in the direction of marine commerce.

England, China, Australia, and other of the European countries, at present cover the widest field of the export trade.

The recent reduction in the price of sugar; lowering the cost fully one cent in the pound; gives an added stimulus to the industry of fruit canning on this coast, and puts the enterprise here on a more equal footing with other countries and States with which we compete in the struggle for the control of the world's markets.

Many of the cannermen, however, claim that this advantage is offset by the increased price on tinplate which brings the cost of cans to an additional eight cents on the dozen. This advance in price of tin is attributed generally to the effect of the McKinley tariff law; but there are also many who are willing to affirm that this is a mistake; the rise being due to a foreign combine on tinplates and recent strikes in the tin mining districts of England.

Whoever it may be, the result does not seem to materially affect the business, or dampen the sanguinity of the canners.

Although the domestic markets are in a flourishing condition, and fully capable of providing an outlet for the entire production on this coast, many of the more enterprising firms are endeavoring to establish a solid footing for their goods abroad, and are making many sacrifices and concessions to realize success. One firm alone, that of B. G. Smith & Co., recently sold from this season's goods, 30,000 cases of fruit through Townsend & Co. of Liverpool, and about 5000 cases to the Australian and other foreign markets. This firm makes a specialty of a high-grade class of fruit, and one of the delicacies that contribute to the dainty luxuries of the British aristocracy in this way has its transition from our California shores. The wisdom of maintaining a high standard of goods is demonstrated by the favor with which the "Anglo-Californian" brand is received abroad. So great has been the recent demand for this firm's goods, that the capacity of the factory has been increased to nearly double, and a side-track railroad run in alongside the warehouse at the foot of Second and Townsend streets.

A new feature, that greatly facilitates the condensation of the business, has recently been introduced into this, and other leading factories, in the shape of the "Wedgewood Capping Machine." This machine enables one man to accomplish the same amount of work that it formerly took four men to do.

This labor-saving invention does not in any way lessen the number of employees, as far as California is concerned, inasmuch as the trade expands with our ability and facilities to compete to the disadvantage of rivals.

Many of the large canneries employ upward of 300 hands during the busy months, and in

the aggregate, in this city alone, the enterprise furnishes work for about 2000 men, women and girls.

The firm of Shemmel & Co., one of the best known of the canned-fruit preparers, employs in its factory fully 250 hands nearly the whole season, and is making still further preparations for increasing its capacity of production to meet its extensive business. Its agents, Williams, Brown & Co., report that the output is complete and amounts to upward of 150,000 cases of fruit and 20,000 cases vegetables. The majority of the goods has already been sold to the domestic trade and to their own brokers in Russia, China, England and Australia. The output of the Cutting Co. will be found equally large when the reports are in.

By these few examples that have been reliably investigated, it can readily be seen that the canners of this coast have reason to feel jubilant. During the month of September—the heaviest shipment of the season overlaid—the figures were 12,075,000 cases and the average price can be safely approximated at \$3.25 per case of two dozen cases.

The great move of the future in connection with the industry on this coast will be the consolidation of the interests of the grower and the canner. There is a prevalent dissatisfaction with the loose and altogether inadequate method now in vogue. Both the greatly interested parties feel that it is obviously necessary to future success in the way of expediency and the proper limitation of cost of green fruit that the institution of the middlemen commissioners be allowed to drop into oblivion.

Steps are already being taken to bring the grower and the canner together on a business basis of mutual interests and profit, and for the time to avoid this needless expense.

Complaints are also rife against the difficulty of competing with cheap and inferior goods that are thrown upon the market. But it would seem that the brand ought to be sufficient protection to a superior article, though of course the industry of the coast will eventually suffer as a whole by these dishonorable practices of unscrupulous firms.

The complaints made by Ex-Labor Commissioner Tobin before the last session of the Legislature in regard to the inadequate ventilation and unhealthy sanitary condition of several of the canneries in San Francisco has undoubtedly been productive of good.

The particular factories that were specified have undergone an entire renovation, and clean, whitewashed walls and improved drainage render the condition of the workers more comfortable.

Mining Bureau Museum.

Recent additions to the collection of the State Mining Bureau are as follows:

Crystals of calcite, La Luz, Mexico; native copper, Carradon, Cornwall; tin ore, West Phoenix mine, Cornwall; silver ore, La Luz, Mexico, and Garnet, Mexico—all from Jas. F. Brooks, Esq.

Very fine specimen of pyrrhite (ruby silver), crystals, Copiapo, Chili, and iodyrite (iodide of silver), Farapico, Chili; from Hon. M. Rosenstock, Iquique.

Gold quartz, Kehoe mine, Mariposa Co., Cal.; Jerome B. Brown.

Sphalerite, pyrite and galena crystals, Webb City, Missouri; Edward Hooper Esq.

Gold quartz from footwall of the Cargo Muchacho mine, San Diego Co., Cal.

Sphalerite, Advance mine, Fresno Co., Cal.; Thos. Agnew.

Several specimens of silver ores from the North Fork District, Fresno Co., Cal.

Gold quartz, showing free gold, Grizzly mine, Los Burros, Monterey Co., Cal.; A. E. Moore.

Quicksilver ore, New Almaden, Cal.; Mrs. H. H. Day.

Large fine specimen of gold quartz from the Kennedy mine, Amador Co., Cal.; J. F. Parks, superintendent.

Crude sulphur (crystallized), Sulphur Creek, Colusa Co., Cal.; W. L. Bromley.

Fluorite crystals, with cockscomb pyrite and galena, Cumberland, England; Williamburgh Scientific Society.

Cinnabar and other specimens from Lake and Napa county mines.

Model of the \$200 gold nugget found last September in the Ruby drift mine, Forest City, Sierra Co., Cal.; C. D. Voy.

Aragonite crystals in basalt, Sulphur Creek, Colusa Co., Cal., and a number of other specimens of minor interest.

ANXIOUS FOR A RAILROAD.—Assemblyman A. J. Bledsoe of Eureka, Humboldt Co., has been commissioned by leading business men and property owners of Eureka to interview the capitalists of San Francisco, Los Angeles, Denver and other cities on the subject of railroad construction to Humboldt bay. The growing importance of Eureka as a shipping point, as well as the varied and extensive resources of Humboldt county, all lead to the conclusion that a railroad connecting this point with the transcontinental lines would be a good paying investment. The people at Eureka are willing to meet the enterprising capitalist half way, and Mr. Bledsoe is authorized to hold out flattering inducements to the company which will be the first to connect Humboldt bay by rail with the outside world.

COLD WATER ON RED HOT BOILERS.—Recent experiments abroad, according to reports thereof, made to show the effect of cold water on red-hot boilers, tend to a reversal of the common opinion that many explosions are caused by turning cold water into boilers while in that condition.

Sierra Placers.

Some Undeveloped Claims.

The Fresno *Expositor* says:

George T. Lemon, who has been mining on a branch of Stevenson creek, a short distance northeast of Pine Ridge, has returned to Fresno for the winter season.

Mr. Lemon was met by an *Expositor* reporter yesterday evening, and the following statements concerning the placer mines of that district were gathered in the course of a general conversation upon the subject:

It has been many years since any great amount of placer ground was worked in the locality, though the existence of the deposits was known to many persons. The gulches in all directions for many miles are placer patents, and some few who have not secured patents have been doing just enough annual work to retain the legal title to their locations.

The ground is easily worked, and there is a noticeable absence of bowlders and cement. The country is pretty well covered with alluvial and some rich float has been found, but the mother vein is so well obscured that search for it has never been prosecuted to any extent.

The gold of this district is coarse in quality, but the deposits are heavy and the nuggets are good sized, ranging from the size of a grain of wheat to that of a double eagle.

Mr. Lemon showed the *Expositor* man a small sack of dust, and the lumps averaged about \$5 in weight. The largest had some quartz mingled in them, and, though heavy, would only weigh about \$12 in gold.

The bedrock is from two to eight feet deep, and its nature is a soft, cheese-like, soapy, granite formation. Mr. Lemon has ground-elutriated about \$1200 worth of dust in the past three months, and has used no quicksilver at all, thereby wasting all the finer particles. He has a hydraulic with a 50-foot pressure, but has not had occasion to use it to any extent.

There is an abundance of water, and it laets the entire season, which is rather short in that locality, owing to the early and heavy fall of snows.

He will resume operations next summer on a more extensive scale, as he is convinced from actual results that that country is extremely rich in placer deposits of the precious metals.

The Indians do considerable panning on the numerous forks of the San Joaquin. They come occasionally to the Toll House, Pine Ridge and Hamptonville stores with small amounts of dust, which they obtain in rather a crude manner, as follows:

The river and creek beds are literally specked with float and fine gold, and the Indians wade and walk along the banks until they site an exceptionally rich spot, when they dive down with a scoop or large pan and fill it with sand and gravel. Coming to the surface, they go ashore and pan out the results, sometimes securing 5 or 15 cents worth of dust at a dive. The process is very slow and wholly original with the Indians, and they devote very few days to the search. They sell the dust to the storekeepers and obtain supplies of food in return.

The hundreds of little streamlets that country are gold bearing, but the work of ground sluicing and hydraulicking has not been prosecuted to any extent except on the very richest ones.

The results of Mr. Lemon's summer work will exert a strong influence in the matter of placer mining next year. Placers are essentially a poor man's mine, as the search for quartz is attended with too much uncertainty and too great expense. Campers, next season, will, no doubt, have pike, pans and shovels in their outfits, and do a little prospecting by way of amusement. Pockets are frequently found and the character of the creek bottoms and rich-looking plateaus will prove attractive and profitable pastime.

The owners of the patents should take encouragement from these rich rewards and go to work and erect hydraulic plants. The gold is there in paying quantities, and it only requires slight effort to secure it. Sluice boxes should have quicksilver riffles in them, as an incalculable loss occurs when an attempt is only made to secure the heavy pieces. To the man who understands the simple matter, the policy of the suggestion will be apparent at once.

It is not unlikely that the tunnel proposition, spoken of in the *Expositor*, some months ago, will be agitated this summer, as its completion seems to be the only manner in which the San Joaquin river bed can be successfully worked. The project contemplates the construction of a canal and short tunnel, whereby the entire river bed will be diverted for a short distance and thus enable the rich placer deposits in the bed to be reached. This proposition seems chimerical, but, should it ever be consummated, immense quantities of gold will be obtained, as the richness of the river bed is a matter of historical fact.

The *Expositor* predicts a busy and profitable season among the placers of the Sierras in that country, next year.

WHAT IS LAMINATION IN BOILER PLATES?—Lamination in boiler plates is due to imperfect welding of the metal while being rolled. It is caused by a deposit of silica, or scale, that prevents the layers of iron from uniting, therefore when the sheets are exposed to the fire the outer layer burns off, or peels, or bulges up in what are known as "blisters."

Proceedings of the Miners Committee.

Carrying out the resolution adopted at a recent meeting of the miners of Plumas county, says the *Plumas National*, the following gentlemen were appointed to act with the president, R. Thompson, of Spanish Ranch, as an Executive Committee: Hon. F. G. Hall of Greenville and Mr. John Nevill of Johnsville.

Pursuant to the call of the president the committee convened in Quincy, Nov. 4th. R. Thompson was elected chairman and Chas. R. Thompson, secretary. A careful view of the whole field was talked over, and it was unanimously agreed that some definite action should be taken to modify and dissolve the many injunctions now lying against the mines of Plumas county. It was the sense of the committee that Judge John D. Goodwin be employed as attorney, and Chas. R. Thompson was appointed solicitor, with authority to receipt for all sums received. The solicitor will soon be started, and make a canvass of the county, and it is to be hoped that every one will subscribe something. The following resolution was adopted:

We consider the resumption of hydraulic mining of vital importance to the future prosperity of the county, not only every miner, but interested, but every farmer, every man, whatever his vocation, and is to be largely benefited, directly or indirectly.

We congratulate you upon the growing sentiment among the people of the State in favor of hydraulic mining. Many of our enemies even concede the justice of our cause. Now is the time to strike for our rights, our interests and our homes, through the medium of our State courts. Now, that friends in the State are willing to help us, let us help ourselves by making and winning the fight here proposed thus restoring prosperity to Plumas and adding thousands to the wealth of the State. We ask you for what we believe your own and the justice good, not to hesitate about subscribing. We hope and confidently expect it to be repaid many fold.

C. R. THOMPSON, Sec'y.

The Carson River Dredge.

Nearly all the machinery has now arrived for the bucket dredge that is to be put on the scow in the Carson river to scoop the valuable material out of the bed of the river. J. H.

Rae now has a small force of men employed putting up the framework for the new dredge. He has also contracted with Mr. McCone of Virginia City for a small four-man mill to be erected on the river, and will, as soon as other work is thoroughly under way, put in a large set of sluices. Some of our exchanges have recently stated that the new dredge was to be placed on a car and run on land. This is not a fact. The machinery for lifting the material from the river will be on the boat, and as this material is brought up, it will be dumped into a Bennett amalgamator. After running through this machine the stuff will be run over a line of blanket sluices on the river bank. It will then be collected, and run through pans in the mill to be erected, and thence it will be run over a Flume or some other contrivance.

It will be seen that the enterprise is quite a large one. More interest is being taken in the scheme now than ever before, and there seems to be hardly a doubt of the ultimate success of the undertaking. The company really has a net of mines. First, it has a quicksilver mine, next a gold mine and lastly a sulphuretted deposit of vast proportions. The system of saving the material, we believe, is a good one, and it is estimated that not over 10 per cent of the material raised will get away. If everything runs smoothly, and the weather permits, the river in the vicinity of the dredge will present a scene of activity next spring.—*Lyon County Times*.

Marble, Granite and Clay.

There are immense deposits of hard, durable and excellent granite in Butte that will come day be utilized. These great granite formations are found in all the mountainous parts, but particularly along the Middle Fork, South Fork, near Bangor, on the Magalla ridge and on the Mountain House ridge. In the valley portion of the county they are lacking.

Good marble, hard and durable, and of snob a quality that it will stand cutting or lettering, has been found in many places. Nearly every color from white as snow to jet black can be seen. The marble deposits are very extensive on the Middle and North Forks of the Feather, and on the former stream in one place there is a gigantic mountain known as Marble Cone, formed of white marble.

We have seen specimens of Butte marble from the Magalla ridge, from Granite Blain and from Marble Creek near Merrimac Mills, that took a splendid polish and seemed as hard and durable as any imported marble. These beds will not be used till railroads are built into the mountains so as to reach them.

In days of various kinds, Butte is exceedingly rich, and when transportation becomes cheaper, we confidently expect to see pottery established. One gentleman has paid much attention to our clay and cement, and tells us that he is positive as good cement can be made here as the famous Portland cement that is so extensively imported.—*Oroville Register*.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

BELMONT MINE.—*Ledger*, Nov. 14: The superintendent reports: Tunnel No. 1 is now in 465 feet; face all in ore of milling grade. The 315 feet of new pipe line ordered several days back is under good headway. The company expect to resume milling December 1st. J. H. Tibbitts, superintendent Belmont gold mine, has placed miners on the Middle Bar Hollywood, Astoria and Elephantine mines to do the assessment work for 1891. The claims are situated on the Mokelumne river near the Hardenberg mine.

WILDMAN.—*Cor. Amador Ledger*: Sinking was commenced at the Wildman this week. On account of having only one bucket to do the entire work of the mine, they concluded to hang up the mill for four weeks, which will in all probability suffice to finish the sinking. They propose to go down 100 feet. The water is strong, but they have four pumps—three powerful Corioish plunger pumps, and one drawing lift pump. They are sinking in the hanging wall, leaving the ledge to the west. The ground is a soft slate, which is a favorable indication, and will enable rapid progress to be made. Thirty men have been laid off temporarily, but in order to impose as little hardship as possible, they will likely be employed a part of the time in turn, so as to give all an equal show. Nine men are kept in the shaft, and six men are working on the stopes. Some ore will no doubt be extracted, and the dumps filled with rock in readiness for the starting of the mill.

Calaveras.

LIMESTONE MARKET.—*Calaveras Chronicle*, Nov. 14: The large smelter of the Campo Seco Co. started up about the 1st inst., and at first the indications were not favorable for successful treatment of the ore. By experimenting, the general manager found that lime rock would "thin" the material and cause the copper to run off freely by fluxing the molten mass, consequently a body of limestone was located on the Mok. Hill and Campo Seco road, near the McNamara place, and a force of men are engaged in quarrying the lime, while six large freight teams are hauling the same to the company's smelter. The stone is of superior quality and there is an abundant quantity on the company's location, the distance to convey it being but five miles. We are informed that H. A. Messenger has contracted to deliver 1000 tons for \$2.50 a ton, and the daily quantity required for "fluxing" to be 15 tons. Thus one more enterprise is started, and one that will prove not only lasting but profitable. We were informed that the furnace was now working to the entire satisfaction of the company and the ore was paying one-third more than they expected.

El Dorado.

NEW MILLS.—*Mt. Democrat*, Nov. 14: A fine 10 stamp mill is now being erected and will soon be ready to run at the Darling mine, where they are now taking out very fine ore. Two Huntington mills are now being started at the St. Lawrence mine, the outlook there is decidedly favorable. The Dalmatia is running regularly with her usual success. At the Talkey mine at Texas Hill they have their tunnel in 450 feet and expect to tap the gravel channel in 50 feet more. The upraise at the Blair mine is expected to tap the gravel at any time. Work at the Toll House mine at Smith's Flat, is progressing as rapidly as possible. Good gravel is now coming out of the old Granite mine at the same place. The mill at the Gentle Annie mine will at once be started up after a lay off for three weeks on account of repairs being made on the big ditch. The S. N. L. W. & I. Company have commenced work all along the line since they got the water through the main canal. They are now driving the north 700 foot level at the Pacific mine day and night. They are opening shafts at the Harmon mine preparatory to running levels for the purpose of stoping. After this work is completed they intend to start the mill up at the mine. As we have stated in a previous issue of this paper, they have 500 feet of back above the tunnel which will be ready to take out as soon as they have these shafts completed and levels run. At the Epley mine they have several thousand tons of ore in sight, that will pay from \$5 to \$6 per ton. Making repairs on the main canal has delayed them for a time, but the furnaces are now completed and are in such condition that they will not be delayed again for years to come. Five additional stamps with a new boiler and other machinery are nearing completion at the Welker mine, near Fort Jim. Work is progressing at the Baltic mine. The ore being taken out is worth \$30 per ton. A five stamp mill will be erected at this mine. A winze is being sunk at the Big Bonanza, and very good ore is coming out. This promises to be a big mine, as the vein is large and the ore rich. We get very favorable accounts from the Manzanita Queen mine in Diamond Springs District. We have been shown some very fine looking ore recently found in Kelsey District, which is said to contain 300 ounces in silver and \$60 to the ton. The ore certainly shows well and there is said to be a large vein of it. There is a belt of silver and gold bearing ore running through this county about three miles west of the mother lode range. If this should prove to be anything like as good as is claimed for it, it may become very valuable when properly developed. It has been partially opened at Big Canyon and other places and shows good looking ore.

Fresno.

OIL PROSPECTS.—*Fresno Republican*, Nov. 13: With every passing day the work of development of the oil fields near Coalinga is progressing with every promise that the fields will show all that was expected of them by the most sanguine. Oil was struck to the Coalinga country on July 26th last by the Coast Range Oil Company. The surface prospects for oil had showed good, and the first well was sunk. At a little over 70 feet sandstone was struck, and at 278 feet oil was found in sufficient quantities to complete the promise of oil made by the surface indications. J. E. Wilson, the superintendent for the corporation, took a sample to Los Angeles, and there the speculators would not touch it for some time, as they asserted it was so pure that it was

doctored. In fact it was, and is about 15 per cent purer in oil than the best ever found in Pennsylvania, and considerably better than the product of Los Angeles and San Buena Ventura counties. At last Messrs. Lacey & Rowland of the Puente Oil Co. of Los Angeles took the lease of the property and agreed to push things. In pursuance to the terms of this lease the Puente Oil Co. prepared to sink a well. The derrick is a substantial structure with several carloads of heavy timber and lumber in its composition. The work of sinking the well was begun only a short time ago, but it is now about 100 feet down and no oil in paying quantities. Others are turning their attention to the new fields and oil claims are being filed on rapidly by others than the original company or corporation. The Union Oil Co. is also said to have a surveyor and party in the field and will make some locations soon. The lease of the Puente Co. includes the 300 feet well now being operated, and the product thereof is being used as fuel in the engine which furnishes the power for sinking the new well. The developments in the fields are being watched with a great deal of interest.

San Diego.

THE GAVILAN MINES.—*Perris New Era*, Nov. 12: The organization of the Gavilan Mining and Milling Company was completed at Riverside last week by the election of the following officers: President, A. S. White; vice-president, J. A. Allen; secretary, C. W. Sylvester; treasurer, J. S. Castleman, general superintendent, Capt. J. H. Crossman. The stock has been capitalized at \$10,000, of which \$75,000 has been taken by some of the wealthiest men of Riverside. Preparatory work, in the way of building dwellings, messhouse, offices and making road, has already begun and will be pushed to completion within 30 days, when it is expected a force of 30 or 40 men will be put to work in the mine, developing it and taking out ore. The ore assays on an average about \$100 to the ton, and is free mill and easily worked. Capt. J. H. Crossman, who has been selected as superintendent, and to whose efforts is due the organization of the company, is a gentleman thoroughly experienced in mining, having been engaged in the business nearly all his life. In addition to the mineral wealth acquired by the company, there is a large extent of very valuable agricultural land, well adapted for all kinds of produce and fruit.

AT OTHER PLACES.—Last week W. Steel sold his group of mines and ranch property in Pinacate district, to J. Judson, a Chicago gentleman. At present Mr. Judson will do nothing with the mines, but will devote his time to setting out an olive orchard, for which the land is peculiarly adapted. In the spring, however, he will put a force of men at work on the mines, put up an extensive milling plant, and go to work in earnest. H. McPhee of the Press has leased part of his claim in Bon Air district to a couple of experienced miners, who will prospect it thoroughly. The mine promises well, and good results are expected from it. A tunnel 150 feet long was commenced this week, and the proprietors expect to ship some very valuable ore within a few weeks. W. J. Lyons, a San Diego mining man, who has been looking at properties in this section for the past three weeks, left for San Diego yesterday. While prospecting about nine miles east of town, he ran across a ledge of tin, samples of which he took with him to have assayed.

OTAY SALT PRODUCE.—*Otay Press*, Nov. 14: At the La Punta Salt Works, at the foot of the valley, Shaffer Bros. have their season's run of salt now housed, and will soon begin the work of putting it through the refining process, which is done by first grinding the salt and then placing it in a steam dryer, where it remains for about three hours, when it is taken out and reground very fine for table and dairy uses, and then put up in 250-pound sacks. This quality of salt is shipped to San Diego by means of a small schooner that is loaded at the works, and much of this salt in bulk finds its way to the northern portion of the State. The salt product for this season was 450 tons.

Shasta.

A SPLENDID PROPERTY.—*Redding Free Press*, Nov. 14: We hear most gratifying reports from the Gladstone mine at French Gulch. It is claimed that there is now in sight enough ore to run the mill constantly for the next three years. In a few days work will be commenced on the fourth tunnel, which will tap the ledge 1000 feet beneath the earth's crust. They have a solid hock of ore and can run on the ledge from the third tunnel up to the first. They have recently purchased a dynamo of the latest Edison patent with which to run their electric drills, and in a few days expect to have the dynamo working in good shape. There is much free gold ore, and, in fact, most of it is good milling rock. The monthly cleanup of this mine is \$13,000, and allowing \$5000 as the cost of running the property, there is a neat balance of \$8000 to be divided up among the stockholders.

IRON.—The stockholders of the Shasta Iron Company recently held a meeting and resolved to do nothing with their mine on the McCloud river except assessment work this winter; but in the spring it is believed that operations will be commenced. Two carloads of ore were shipped to San Francisco not long since, and the test made was entirely satisfactory, the ore working up to 95 per cent. Robert Radcliff has charge of the property.

Sierra.

EXCELSIOR.—*Mt. Messenger*, Nov. 14: Loeffler Cadeza and Lassait have received the contract a the Excelsior to run 200 feet of tunnel. The tunnel is in 1192 feet. After the 200 feet are completed the company expect to tap gravel, and, no doubt, will have a good mine according to present indications.

AN OLD CLAIM.—Messrs. Fish and Burgan have sold the old St. Lawrence drift claim, at Excelsior, to a man by the name of Anderson, a resident of that section in early days. It is said that he left good gravel unworked there when he left over 30 years ago, and he now intends to take it out.

ANTE UP.—We are pleased to learn that prospects in the Ante Up quartz claim, near the Mt. House, are favorable. The company has good rock in sight and quite a quantity of it.

Trinity.

A QUICKSILVER MINE.—*Nevada City Transcript*, Nov. 16: Joseph F. Cox, superintendent of the Midnight mine at this city, returned to-day from a trip to the Altona quicksilver mine, in Trinity county, midway between Trinity Center and

Castle Craig Station, on the California & Oregon railroad. Mr. Cox was on the first instant appointed manager of the Altona, and will fill that position in conjunction with his duties here. The claim was worked previous to ten years ago, and produced \$160,000 above water level, but since that time a controversy between members of the company who are now in a fair way to arrive at an agreement has prevented the continuation of development. The ore body is 600 feet long, and averages ten feet in thickness. It is what is known as four-per-cent ore, and abounds in crude mercury. A new road and two bridges that will make the haul from the mine to the railroad, only 14 miles, are to be built, and in the spring two Knox channel furnaces are to be put in. Mr. Cox is an experienced and successful quicksilver miner.

Tuolumne.

MINE SOLO.—*Tuolumne Independent*, Nov. 14: The McPherson & Hilton quartz mine, at Saw Mill Flat, has been purchased by A. Grahani, of Saw Mill Flat, and Thos. Conlin, of Columbia. This week they received a Hercules gas engine, 1½ horse power, from San Francisco, which will be used for hoisting. The tunnel is sunk 100 feet, and from the bottom of this shaft is sunk 100 feet, or 160 feet deep from the surface. The vein averages two feet in width. All the rock pays to grind, and occasionally nice pockets are found. The average is \$8 per ton, and the pockets swell the yield to an encouraging amount when uncovered.

NEVADA.

Washoe District.

CON. CALIFORNIA & VIRGINIA.—*Enterprise*, Nov. 15: 1500 level.—The west crosscut from the main north lateral drift, at a point 150 feet north from the shaft station, has been advanced 30 feet; total length, 90 feet, in porphyry carrying clay and some quartz. 1600 level.—The various openings on this level continue to yield some ore. 1650 level.—Have continued to extract ore of fair quality from the drift run west from the top of the upraise carried up 59 feet above the southwest drift. 1750 level.—Is working out and upward from the bottom of winze No. 2, sunk from the 1650 level, we continue to extract ore of fair quality. Have also extracted some milling ore at the point where the upraise carried up from the crosscut run west from the southwest drift made connection with the stopes on the eighth floor. Have continued to extract ore of fair quality at the point where the upraise from the southwest drift, 70 feet north from the south line of the California ground, connected with the eighth-floor stopes. There has been extracted from all parts of the mine during the week 990 1080-2000 tons of ore, which was shipped to the Morgan mill. The average assay value of all the ore worked at that mill during the week (980 tons) was \$23.62 per ton. Bullion shipped to Carson Mint; assay value, about \$11,434.72.

OPHIR.—1465 level.—Have continued our prospecting work near the point where the upraise from the sill floor of this level connected with the drift run west from the winze 122 feet below the sill floor of the 1300 level. No ore has been extracted during the week.

MEXICAN.—On the 1465 level the winze started at the end of the crosscut run west from the north lateral drift at a point near the south boundary line of the mine, 132 feet in, has been sunk 14 feet in porphyry carrying quartz of very low assay value.

UNION CON.—On the 900 level the joint Sierra Nevada and Union Con. west drift is now out west of the shaft a distance of 1352 feet, and the face is in clay and porphyry.

GOULD & CURRY.—200 level.—South drift from east crosscut No. 1 has been extended 18 feet through old fillings of a fair quality; total length, 53 feet. West crosscut No. 1, 65 feet above 200 level, has been advanced 20 feet; total, 231 feet; face in porphyry, clay and stringers of quartz.

BEST & BELCHER.—1000 level.—Upraise No. 1 has been carried up a distance of 9 feet through hard porphyry; total height, 27 feet. Have done considerable repairing on the 1200 level during the week.

Eureka District.

A DEVELOPMENT IN THE DUNDERBERG.—*Eureka Sentinel*, Nov. 14: We hear that the Dunderberg Co. has struck ore on the 800-foot level of their mine. We are not advised as to the extent of the development though we understand that considerable good ore is being brought to the surface. This find is important, as being deeper than any ore hitherto developed in that particular section of Prospect mountain. In the early days the Dunderberg was one of our most productive mines, having yielded more than \$2,000,000 in bullion. We may at least hope that the recent strike at depth will prove more valuable than the upper levels.

Reese River District.

GOOD TIMES AT AUSTIN.—*Reville*, Nov. 13: The Austin M. Co. have, at present, 50 men at work in the Union mine, and are constantly putting more to work as soon as a place is made ready for them. All the employees of the company received their month's earnings Tuesday, and about \$6000 worth of checks was cashed. It is four years since this number of men have been on the pay-roll in Austin, and in place of the sorrowful countenances, caused by the depression which hung over our camp, we now notice complacent smiles; pessimists have changed to optimists; business is on the revive, and every indication points to long and continued prosperity.

Tuscarora District.

DEL MONTE.—*Times-Review*, Nov. 13: Second level.—West drift from No. 1 joint raise has connected with stopes. North drift from No. 2 joint raise in 25 feet. Hoisted 55 cars of ore.

NORTH COMMONWEALTH.—Second level.—West drift from south drift extended 20 feet. West drift from No. 1 joint raise has connected with the stopes. Winze from stopes down 10 feet 18 inches good ore in bottom. Hoisted 6 cars first-class and 30 cars second-class ore. Stopes are looking well. Shipped to the railroad 31 tons first-class ore.

NEVADA QUEEN.—South drift from second level of Commonwealth advanced 21 feet, exposing good ore in bottom of the drift.

COMMONWEALTH.—South drift from No. 2 raise entered the vein and follows the footwall, showing some very high-grade ore. Progress for the week, 25 feet.

NORTH BELLE ISLE.—No. 3 north drift, 400-foot

level, has been advanced 10 feet; vein remains unchanged since last report. No. 2 upraise from the drift extended 15 feet. A crosscut east, at the bottom of No. 1 winze below the 400-foot level, has been commenced. Progress seven feet, cutting some good ore below the fault mentioned in last report. East crosscut from north intermediate drift above 400-foot level extended six feet and stopped. North intermediate drift above 400-foot level advanced six feet. Line crosscut, 400-foot level, Belle Isle, advanced 12 feet; face looking more favorable. Stopes are producing the usual amount of good ore.

BELLE ISLE.—North drift, 150-foot level, advanced five feet in very hard rock. Line crosscut, 350-foot level, extended 18 feet and remains unchanged. Stopes are producing the usual amount of good ore.

Piocha District.

The two furnaces are doing well and the output of bullion is very satisfactory. The locomotive is kept busily engaged night and day bringing in ore and wood and has all it can do to keep the smelters supplied. An oil house has been erected away from the main building so that in case of fire, it cannot come in contact with the main works. The slag dump is now being extended as far as possible around the pond embankment, making a substantial breastwork to support the loose ground. Upon the completion of the new locomotive it will at once be put on the Jackrabbit route, while the one now running on that section will take the Yuba, Meadow Valley and Raymond circuit. Quite a number of the hoads are beginning to erect dwellings in the vicinity of the works. The various styles of architecture would puzzle a modern architect to know what period the plans were drawn from. It is the intention of the superintendent to adopt stringent measures in regard to employees not being on hand at the time of their regular shift. No excuse will be allowed men for not being on duty unless in case of sickness and notification of the fact made before the shift goes on. Following are the amounts of ore smelted during the week, and the amount of bullion produced at the smelters: 1,203,990 lbs of ore and 923 bars of bullion. Counting the tonnage of ore, and assuming the bars of bullion to weigh 100 pounds each, the above report shows the smelting charge to carry from 8 to 10 per cent of lead. On the 10th inst. No. 1 furnace was barred down.

ARIZONA.

MILL NEARLY READY.—*Prescott Courier*, Nov. 13: The Parnell mill machinery is all on the ground and being put up as rapidly as possible, and it is expected that it will be running within three weeks. Paul Johos is at the Mammoth mine, Silver Mountain, where he has a gang of men at work. This mine is located 4½ miles south of the Tiger, and, as its name indicates, is a mammoth ledge. It is a contact vein, 300 feet wide and all ore, between granite and schist walls. Prospectors familiar with the Gladiator mine, on the War Eagle ledge, 35 miles from Prescott, say it is a wonderful piece of mining property. For 6000 feet the vein can be plainly traced on the top of the ground, and rock from any point on the surface of the ledge runs \$20. As it is a well-established fact that mines in this section increase in extent and richness as depth is reached, a few thousands spent in developing the War Eagle might bring about wonderful results. Judge Noyes has returned from a trip through the mining districts, where he went as much for curiosity as anything else, to look at a lot of old mining claims which he located and knew of many, many years ago, but which were abandoned from various causes, some of their owners having long ago crossed to the other shore. He states that nearly all these old claims show recent work, most of them being developed by deep shafts or long tunnels, and as a matter of fact, those showing the largest amount of development also show the best veins of rich ore.

COLORADO.

TITUSVILLE MILL.—*Silverton Standard*, Nov. 7: The Titusville mine and mill are running day and night on the new strike of rich gold-bearing quartz made recently, and the grade of the concentrates is running very high, while the amount of gold caught on the plates is heavy. A large force of men is employed on the property. The Mountain Quail, on Little Giot mountain, is turning out \$500 gold quartz, a shipment made the other day yielding over \$400 net in clean cash. The property is only a prospect, and has been lying idle for a long time. The Iowa mine, in Silver Lake basin, is working and shipping steadily, and everything is made snug for the long cold season. The mine has been a steady shipper all spring and summer. Down at the Thunder mine, they are taking out blocks of gray copper that are as large as bushel baskets. The fact that such ore bodies are being unearthed in that part of the district would indicate that the back of the old Sultan has hardly been scratched yet.

DAKOTA.

D. & D. SMELTER.—*Deadwood Pioneer*, Nov. 10: Both of the furnaces at the D. & D. smelter are now being modified by the addition of lead wells. It is stated that the reason for this lies in the fact that too great a loss of silver occurs by volatilization in straight matte smelting. By passing the matte over a well filled with lead, it is desilverized to a great extent, and the loss in subsequent roasting greatly reduced. Some lead carbonate ore from the Hayes mine at Galena, which has a contract to deliver 50 tons, is now in the ore bins. A fine grade of pyrites, assaying, it is said, over \$40 per ton, has been obtained from the Dakota mine, in Strawberry gulch, but only about five tons have so far been delivered. Two wagon loads of carbonate ore, amounting to about four tons, were hauled to the smelter Monday, from a group of claims near Virginia City, owned by Bert Harris and others. It is said the works will be in operation again in about two weeks.

CORA MINING COMPANY.—This mine is situated at Galena, and has been worked more continuously than any other mine in the Bear Butte district. All

of the ore has been of a high grade, principally galena and lead carbonates. At present, five men are employed, and the mine produces about half a ton per day of lead ore. The average value is about \$200, according to the returns from Omaha. The company is now entirely out of debt and has a small surplus to the treasury, which is being added to monthly.

IDAHO.

PUMPED OUT.—Wood River Times, Nov. 11: Thad D. Bellinger is in from the King of the West mine, in Smoky, where he has charge of the machinery. He says that the mine is just pumped out, that the winter supplies are all in, and that by the end of next week about ten men will be put to work for the winter. The draining of the mine was no small job, as there were over 1500 feet of shaft, winzes, raises and drifts, besides the stopes, to pump out, and for a while it seemed as if a fresh body of water had been tapped. Seventeen days were required to drain the workings.

ARIZONA.

IN MOHAVE CO.—*Miner*, Nov. 14: The Music Mountain mines are showing up well under development. The claims of Wm. Muon are splendid silver-producing properties, and the gold mines of that region are unexcelled. Hitchcock & Brumach have finished timbering the Tuckaboe shaft and stopes, and have just started in taking out ore. Cooley & Tyler are taking out an immense amount of ore from their new location situated between the C. O. D. mine and Canyon station. The ore is reported to be very high grade. Ed Henson is in from the Arlington mine, on Sherum's Peak, near Mineral Park, where he is working at present. He informs us that he has two carloads of high-grade ore on the dump which will be shipped to the sampler next week. In the drift from the bottom of the Diamond Joe shaft a fine body of ore has been struck. The ore is solid black metal, and the streak is fully 18 inches in width. Conrad & Conrad are hard at work on the Little Boy mine. They have been engaged in timbering up the tunnel, and will soon commence driving ahead under the ore. The Flores mill was started up Wednesday, and everything was running smoothly when our correspondent left. There are several hundred tons of ore on the dump ready for crushing. Davis & Garrett will make a large shipment of ore from the Western Vine mine, on Sherum's Peak, in a few days. The drift from the 100-foot level of the Berkeley mine is being pushed ahead, and is now nearly under the old shaft. The immense ledge of gold ore running 99 per ton, recently discovered in Gold Basin will soon become one of the great bonanzas of the coast. The Colorado river furnishes ample power to run a 200-stamp mill and dynamos to give power and light at the mine. The entire expense of fuel would be overcome. The river current runs at the rate of 10 miles an hour at a point where a mill could be placed and current wheels could be placed therein without number. Ogden and Bissett have a carload of ore at Hackberry awaiting shipment to the sampler. The ore was taken out in sinking the shaft on the Olympia mine, in Cedar district, upon which they have been at work for the past three months. The mine has been opened up in such shape that a number of thousand dollars in ore can be knocked out before the first of the year. From samples taken of the carload now awaiting treatment, it is expected that the boys will get \$1500 over and above all cost of extraction and reduction. They have a large quantity of 100-ounce ore on the dump, which will be shipped to the sampler at the next cleanup.

NEW MEXICO.

DEVELOPMENT WORK.—Silver City Enterprise, Nov. 13: T. S. James has a lease on the south extension of the Pacific, and has 12 inches of good pay ore. The Grant County M. and M. Co. turned out ten silver bricks during the past 12 days. The smallest brick weighed 44 pounds and the largest 87 pounds. The mill runs day and night and is never short of ore. It is proving a great benefit to many miners in this section. The Uncle Sam mine has been handed to the Grant County M. and M. Co. for \$50,000. During the term of the bond the company will work the mine, paying the owner, Jo E. Sheridan, a royalty on all ore milled. In doing the assessment work, the ore taken out and shipped to the mill returned a 700-ounce brick, which was shipped via Wells Fargo on Wednesday. The Maud S., on Silver Creek, shipped another of those gold and silver bricks weighing 114 pounds and valued at \$2500. This was from a ten days' run of a five-stamp mill, stamps weighing 450 pounds each. Frank Vingoe has been shipping ore to the Grant County M. and M. Co. of this city, and as a result was able to reduce the indebtedness of his company about \$2000 on the first shipment. He expects to continue to ship ore to this city, and will have all of the indebtedness paid off by the first of the new year. James St. Clair, who, in connection with Jeff Christian, is leasing on the Red Cloud, at Black Hawk, informed the Enterprise that they are still in bonanza. They have seven tons of ore out, five of which will be shipped by express. Several different parties leased and worked the Red Cloud, but gave it up before good ore was struck.

UTAH.

CAMP CROSSCUTS.—Park Record, Nov. 14: About two feet of snow on the level is reported up at the Crescent mine, which means that bare ground will only be seen in spots until next spring. The Crescent tramway was closed down permanently yesterday. The engine is housed, cars put away, and everything made snug for the winter. The large amount of honest prospecting that has been and is being done on Treasure Hill should be productive of a rich find before spring comes again. It is about time another rich ore chute was discovered on that hill, and the general opinion is that it will be before long. The Silver Key has an enormous vein of low-grade ore, but the present low prices of silver and lead prohibit its being stoped and concentrated. A raise is now being run to connect the tunnel with the old shaft. The Roaring Lion lessees have laid in a supply of 145 tons of coal, besides making other important arrangements to prosecute developments all winter. The mine is looking extremely

favorable, and the indications are that Messrs. Gitsch, Rice and Sullivan are lucky men. The winze is going down steadily, and the vein is improving with every foot in depth. Considerable ore is being taken out and stored. The report of the rich strike in the West End group last week turns out to be a mistake, none of the officers of the company knowing anything about it. The ore exhibited around town came from the incline, but was a picked sample, as quite a number of bunches of rich ore occur in the vein. Henry Newell is now vigorously prosecuting work on his group of claims located on Treasure Hill. He is driving a tunnel to cut the contact and means to keep at it until he proves the ground. The group is a valuable one in the judgment of men who know the formation of that hill.

WASHINGTON.

GOOD ORE.—Oregonian Outlook, Nov. 6: The Wehe brothers at Golden recently shipped to the Tacoma smelter 13 tons of ore from the Adela which milled \$125 per ton. With a mill on the ground this ore would pay large returns. M. S. Dudley has just received returns from the shipment of Dexter ore made about three weeks ago. It went \$265 a ton in silver. While this is not quite as high as the owners expected it to run, as a mill test the result is altogether satisfactory.

SILVER STAR.—Capt. Curtz, general manager of the Silver Star Mining Co., which recently commenced development work on their Palmer mountain prospects, was in Concomely several days this week. He reports the Silver Star looking fine at a depth of 75 feet in the shaft. During the recent visit of J. D. Caughran, who represents the Tacoma interests in the company, it was decided to put up a whim and continue sinking, at least, to the depth of 200 feet. If the ledge looks as promising at the 100-foot level as it does at the present time, when that point is reached additional force will be put on and the work of drifting and sinking prosecuted at the same time.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING NOV. 10, 1891.

- 462,938.—WARDROBE—W. T. Cottier, Los Angeles, Cal.
- 462,936.—DENTAL ENGINE ATTACHMENT—E. D. Eddy, San Mateo, Cal.
- 463,111.—FRUIT CRATE—C. E. Gates, Oakland, Cal.
- 463,042.—HYDRAULIC ELEVATOR VALVE—C. I. Hall, S. F.
- 463,049.—DIFFERENTIAL IN ROLLER MILLS—L. D. Harding, Colfax, Wash.
- 462,952.—GOLD-SAVING APPARATUS—J. H. Hobart, S. F.
- 463,053.—METALLIC ROD-PACKING—J. B. Houston, S. F.
- 462,953.—DAMP-PROOF AND WATER-TIGHT CELLARS—P. H. Jackson, S. F.
- 462,800.—PIPE PUNCH AND CUTTER—J. O. Kafader, Fort Bidwell, Cal.
- 462,768.—CROSSCUT SAW—Wm. Kidd, Fisherman's Bay, Cal.
- 462,955.—HYDRAULIC ELEVATOR—A. J. McAdam, S. F.
- 462,986.—POWDER DISTRIBUTOR—W. D. McCann, S. F.
- 463,071.—CAR CONSTRUCTION—G. W. McNear, Oakland, Cal.
- 463,068.—HOSE-HOLDER—J. & R. H. Moore, S. F.
- 462,954.—STOVE FOR HEATING AND LIGHTING PURPOSES—J. T. Myers, S. F.
- 463,084.—MOUTH-PIECE FOR CORNETS—C. H. Van Allen, Halsey, Oregon.
- 463,013.—TAIL-PIECE FOR STRINGED MUSICAL INSTRUMENTS—W. Van Deventer, Tacoma, Wash.
- 462,755.—BUCKLE—A. E. Winlow, San Jose, Cal.

The following brief list by telegraph, for Nov. 17, will appear more complete on receipt of mail advices: California—William Cameron, Milpitas, hit stock; William W. Flewelling, Kingsbury, hub and axle; Erastus W. Ceddings, San Francisco, wash boiler; John Hackett, Oakland, dock scraper; William Leavgood, Sacramento, wagon jack; Mark P. Madden, Coronado, device for tapping mains; William Martin, Glenwood, fumigator; Robert B. Vanderberg, Long Branch, fruit gatherer; George Weeks, East Oakland, railway rail joint coupling; Mora M. Barrett and J. F. Daly, San Francisco, two patents, one for operating the mechanism for gas engines and the other for a valve regulating the governor for gas engines.

Oregon—Robert R. Richardson, Portland, mail wagon.

Arizona—Frederick A. Blackburn, Bisbee, buckle fastener.

Nova Scotia—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AUTOMATIC ORGAN.—Geo. F. Wells, S. F. No. 462,460. Dated Nov. 3, 1891. This is one of that class of organs using perforated music paper and known as automatic organs. The invention is applicable to pipe-organs and to those organs which, while employing reeds, have, by reason of their peculiar construction, the effect of pipe-organs, and which are known to the trade as "vocalion" organs. The main object of this invention is to adopt pipe and vocalion organs to be operated by perforated music paper. The invention consists, in addition to a novel pneumatic valve-operating mechanism, of means by which the perforated music paper controls and operates that mechanism.

STOVE FOR HEATING AND LIGHTING PURPOSES.—John F. Myers, S. F. No. 462,954. Dated Nov. 10, 1891. The object of this invention is to provide a device by which the inventor is enabled to use an ordinary coal-oil lamp within a grate or fire-

place, and by the employment of a peculiarly constructed inclosing casing, to prevent the flame of the lamp from being affected by the usual strong draft of the chimney-flue. It has also for its object a means for providing a proper circulation of air about the lower part of the lamp and oil-chamber without subjecting it to the chimney draft, a means for concentrating the heat and projecting it into the room, and a means for opening communication with the chimney in order to discharge the odors arising when the lamp is extinguished, and prevent their escaping into the room. The device is adapted to be fitted into the fireplace or opening for any grate by simply removing the basket and ash-pan therefrom. The heat will be thrown out by direct radiation and by the action of the reflector behind the lamp, and the room will at the same time be lighted sufficiently for ordinary purposes.

HYDRAULIC ELEVATOR.—Alexander J. McAdam, S. F. No. 462,955. Dated Nov. 10, 1891. This is one of that class of elevators operated by means of water under pressure acting through moving pistons connected by suitable ropes or cables with the traveling cage or car. The object is to provide a simple and effective hydraulic elevator in which great economy in the consumption of water is secured.

DAMP-PROOF AND WATER-TIGHT CELLAR.—Peter H. Jackson, S. F. No. 462,953. Dated Nov. 10, 1891. This invention relates to building, basement, cellar and vault constructions. The object is to increase the stiffness and strength of walls or floors of buildings without increasing their thickness, so that a structure will remain integral or as originally constructed even after great lapse of time, will resist tensile strain, remain erect under the weakening effects of fire, and may even be able to withstand earthquake shocks and oscillations; to construct basements, cellars, vaults or the like in such manner that the inside will be entirely free from dampness; to construct foundation walls or the walls of basements or cellars on soft bottoms in such manner that they will be capable of sustaining the buildings above them without the employment of piles or other ordinary means for upholding foundations on soft bottoms, and, finally, to prevent the tops and bottoms of stiffened walls from being pushed inward when subjected to pressure from without. With these objects in view, the invention consists in a wall, floor or the like, having upon its top surface supporting walls, and comprising in its structure, along with surface masses of concrete or the like to resist compression, metallic ties or beams embedded slightly beneath the interior or upper surface for the purpose of resisting tensile strain from transverse pressure inward or upward; furthermore, in a wall, floor or the like, composed of two portions—an outer and an inner—the outer portion capable of resisting compressive force and the inner portion capable of withstanding tensile strain, the two portions united by a stratum of asphaltum, or any equivalent water-resisting substance, extending along the neutral axis of the wall or floor, whereby the cellar is rendered damp-proof, and by exclusion of moisture, the metallic parts near the interior surface of the wall are preserved in a constantly dry condition, and any relaxation of the adhesion of the cement thereto is prevented; furthermore, in a wall or floor consisting of an outer and an inner portion united along its neutral axis by a stratum of damp-proof material, the outer portion constructed of cement, artificial stone, or the like, and the inner portion composed of similar material and provided with metallic ties or small beams embedded in it, whereby tensile strain may be successfully withstood and the floor or wall be prevented from bursting inward; furthermore, in a wall or floor composed of two portions united along the neutral axis by a stratum of damp-proof material, the outer portion made of cement, artificial stone, or similar material capable of resisting compressive force, and the inner portion constructed of like substance and consisting of inverted arches having metallic ties or small metallic beams embedded in the foot of the arches for the purpose of withstanding the tensile strain; furthermore, in the combination with the walls having metallic beams, of beams and hocking pieces to resist pressure above or below, or both above and below, and, finally, in various novel details of construction whereby the objects of the invention are attained.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department 10, San Francisco:

OCCIDENTAL MANUFACTURING CO., Nov. 12. Capital stock, \$1,000,000. Directors—Thos. Price, A. F. Price, J. N. Steinberger, F. J. Field and C. E. Gruban Jr.

PHELPS MANUFACTURING CO., Nov. 12. Capital stock, \$50,000. Directors—W. S. A. E. and A. Phelps, W. H. White and P. B. Horton.

GEO. E. PLUMMER & CO., Nov. 13. Capital stock, \$100,000. Directors—G. E. Gormley, J. J. Gormley, Jennie T. G. E. and W. P. Plummer.

DEL MONTE FRUIT-GROWING CO., Nov. 13. Capital stock, \$150,000. Directors—T. Cleary, R. M. Mastick, J. Willard, O. F. Norman and Robt. Jardine.

ARGYLE CON. M. CO., Nov. 17. Location, White Pine Co., Nev. Capital stock, \$1,000,000. Directors—Chas. H. Fish, J. D. Fry, James Treadwell, J. Stadfeld and H. G. Blasdel.

SUTTER COUNTY CEMENT MFG. CO., Nov. 17. Capital stock, \$500,000. Directors—C. E. L. Cross, Hom Wrede, J. Chitwood Jr., T. M. Davis and W. H. H. Graves.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. C. HOAG—San Francisco.
R. G. BAILEY—San Francisco.
Geo. Wilson—Sacramento Co.
J. H. CROSSMAN—Fertile, Cal.
CHANDRY A. DAYTON—San Lucas, Cal.
G. R. GIL—Cambridge, Cal.
WM. T. HEAD—Ukiah, Cal.
Mrs. GEORGE DECKER—Fillmore, Cal.
ROBERT H. ASHER—El Cajon, Cal.
F. K. MERRITT—Healdsburg.
FRANK A. SWEETSER—Yolo Co.
W. E. BRAYTON—San Benito Co.
J. T. ADGIST—Tulare County.

Mining Share Market.

The advice given last week that a profit in hand is better than the promise of larger profits by holding, proved true the past week, and those who acted on it have no reason to complain. From the lowest quotations in this month, several of the stocks, notably of the Gold Hill and Devil Gate mines, doubled in value. From the highest price reached there was a decline of from 15 to 30 per cent. The situation at the mines and the condition of the stock market warrant much better prices for many of the shares. The only danger to be feared is that when the pool makes the market more active at much better prices, the gudgeons will come in as buyers, and in their scramble send prices above what the situation warrants, which, if done, will allow the pool to unload, short the market and through cross-orders send prices down with a rush, leaving outsiders with stock on which to pay assessments for some time afterward.

Outside mining shares begin to act suspiciously strong, as if they are under manipulation for much better prices. These shares have been unduly depressed, with assessments levied at regular intervals, until the outside public, who had been induced to buy at high prices on big bull points, had been frozen out at the time when they should have bought. While the depression was under way, extensive and systematic prospecting and developing work was done in the leading mines in the Tuscarora, Bodie and Quijota districts. Ore in several of them was not only found, but cut on two or more levels in its downward continuations. As each level was opened up, it was connected with those above for ventilation and better working, so that the mines are in most excellent condition for future working and extraction of ore, and as the shares are quite low, it looks as if those who buy and pay cash will make a good round profit on the venture.

Mining shares opened this (Thursday) morning inactive, continuing dull in the informal session, up to 11:30 o'clock, when, under a bear raid on the North End shares, the prices shaded off, which had the effect of bringing in outside sellers. There is a strong feeling that the lateness of the season, with the holidays being near at hand, will interfere with a successful bull movement. Reports are current of a pending assessment on Challenge, Crown Point, Potosi and Best and Belcher. If the market is down or around to-day's prices, when they are levied, it is likely the shares will not shade off much, but if it is higher, then it is reasonable to look for a decided set back.

Street reports are current that there is a pool formed by brokers and a few outsiders, which has been buying Belcher and Sierra Nevada, and are now after two of the Gold Hill mines. A diligent inquiry, resulting in our tracing the stock to T. Whitely & Co., brokers, who confirmed the statement that they held a large block of stocks of each of the mines, but they would not give any particulars, or why and for whom they are held. To an outsider it looks as if a contest for control of the mines is near at hand, yet it may be a trick to draw in outside buyers to unload at a good round profit.

The suit of M. W. Fox against the directors of the Hale and Norcross for over \$2,000,000, which it is alleged, was misappropriated, is on trial before Judge Hebbard. Interesting developments are looked for. Both sides are fighting hard and leaving nothing undone to secure a favorable verdict for their respective sides. At the opening trial on yesterday, H. M. Levy, president, and Mr. Keating, superintendent of the mine, were absent, but why is an open question.

From the Comstock mines, our advices are very favorable. It is claimed that there is an improvement in the Con. Virginia north drift running toward Ophir, which ought to make itself felt soon in the share market. In the Mexican winze, favorable news is looked for soon. In both Union and Sierra Nevada, the developing work is said to be looking well. In Best and Belcher, and also in Gould and Curry, the work is important; but another assessment may be required before the management will be able to show up anything. Extensive developing work is still under way in Savage and Hale and Norcross. In both mines, they are uncovering considerable good to high grade ore. The drifts that are being run from Potosi into Chollar will bear close watching. Bullion appears to be working on its own responsibility, looking to the development of some good to high grade ore. The work in Ward shaft appears to be mainly to develop at that depth Julia, Potosi, Bullion and Exchequer. Good results are looked for, but another assessment may be required to bring it out to perfection. It looks as if Challenge and several of the other Gold Hill shares are being quietly picked up by strong buyers, owing to the work going on. This work, which is mostly secret, is of a most important nature yet it may take several months before a good showing will be made. They are opening up several levels to the west. In the Alta group, bullish reports are afloat. In Belcher, a crosscut has been started on the 300 level, to cut the downward continuation of the ore assaying as high as \$35 found on the 200-foot level.

From the outside mines, our advices report that rich ore continues to be saved in several of the Tuscarora mines while opening up several levels for better working and the extraction of ore. Similar advices come to hand from the Bodies. From the Quijota mines, our advices report more active development work under way, and that the mill will start up soon. It is expected that in the Central and Emma mines, men will be put to work soon, so as to open them up. In Eureka, Holmes and Mt. Diablo, active developing work, with the extraction of ore, is under way. In Silver King, rich ore has been struck near the grass roots.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their SCIENTIFIC PRESS Patent Agency (S. F.) from week to week and year to year.

MECHANICAL PROGRESS.

Hammering Saws.

Of the very numerous sawyers in mills scattered all over the country, not one in a thousand has as yet learned that most important part of saw tactics, adjusting the tension and truing up a circular saw. Many sawyers say they can straighten a long saw, but 90 per cent do not know how to take a twist or wind out of it, so it will lay down flat and touch at all four corners. A long and a circular saw are much alike in this matter, although a different method is pursued to accomplish the same result. This is done with a hammer beat of about six to eight pounds weight, on a smooth-faced anvil, round and rounding face, using a straight edge 40" to 48" and one about 10" long for testing in various ways. A twist pen is best for truing up in most cases.

In taking one, step by step, through the methods of treating various fanits of saws, each part is as essential as the other to know; and, until the whole is pretty well learned, the sawyer will not be satisfied, but he must not be discouraged, nor yet think he has it until results justify his expectations. A large round piece of metal, or a long strip like a crosscut or drag saw, has to have an even tension throughout to lay or stand in a true place; further, this tension is varied by what the thing has to perform after the proper tension is secured to make it true. For instance, a 50" circular saw running 800 to 900 times per minute, is thereby stretched on the rim more than at the center. This buckles the edge in reverse curves and causes the saw to run out of a true plane to get by this. Now, when the tension is increased at the center to some extent by hammering, and the edge is expanded by speed, the saw will become equal throughout and not buckle.

Most substances are more or less elastic—that is, they change shape and return to their former shape as soon as the conditions causing this change of shape are removed. When the pressure is great enough to overcome this elasticity, the thing remains set to the shape conditional to the power applied. Take, for instance, a piece of wax and pinch between the thumb and finger. The part immediately between the thumb and finger is compressed and crowds the outer edge. This causes the outer edge to have more tension—that is, it is strained, but yet not altered in shape. So it is with a steel saw-plate. The tension in the rim is covered by hammering the saw-plate near the center, but not enough to alter the shape of the center or edge, either one, yet the tension or strain is in the edge, and when the strain or tension is increased by speed and labor, the plate still remains true.

Suppose this center hammering should be carried far enough, the center then drops through like an oil-can bottom where this over-strain is made to serve as a spring to eject the oil from the can. In a saw this condition is analogous to a tire-bound wagon-wheel. The hub huckles through because the rim is strained by the center bearing greater than can be retained in a true plane. This tension or strain in a wagon-wheel is made to serve a useful purpose—to hold the wheel dished so as to resist the outward push of the axle-tree when the load on it inclines that way. Now, if you were to hammer the tire of the wheel, the hammering would stretch it and make it larger, so the tension would be removed to the extent of the hammering.

The same rule holds good in sawplate. If the saw is actually rim-bound—that is, if the edge is too small for the center—it should be hammered on the edge to remove the tension somewhat. Now, if you should run your saw fast enough, this rim-bound condition would cease while the certain rate of speed was kept up, and vice versa. If the saw is center-bound and rim large, the center is expanded by hammering to meet the large edge or rim. It must be borne in mind that when the edge is too large and the saw is center-bound, the speed makes matters worse, and your saw then runs snaky or Virginia-rail-fence style, reverse curves in the cut.

This subject of tension is not fully understood by the best saw-makers in the United States. One of them wrote me that he thought the cause of the croaking of the saw-plate in cold weather was due to hammering the center open too much, that it caused the edge to be strained, etc. That was true when the plate was at rest, but, when under speed, it was not, for the strain or tension was removed. If this had anything to do with breaking at all, it was because the center was not expanded enough, for I have tried it out and out. I find that for cold weather a saw must be hammered more open than in warm weather to avoid breaking. *O. E. Grandy in Industrial American.*

THE LATEST ARMOR-PLATE TESTS, now in progress by the government engineers at Annapolis, will probably prove one of the most important ever made, and has already resulted in showing the superiority over all others of the American nickel plate made by the Harvey process at the Government works at Bethlehem. By this process the face of the plate is so treated as to harden it several inches deep, leaving the remainder in its original condition. It is intended to secure the same result that was sought after in the compound plate—a hard face having a tough back. The object is to keep out or break up the projectile on the out-

side, while the tough back holds the whole plate together. Secretary Tracy, who was present at the time, with many other government officials and army officers, expressed himself as highly pleased with the result of the trials. He especially remarked that they showed the high efficiency to which American skill had reached in this important direction, and added that American manufacturers had nothing to fear from any competition abroad. These experiments were made October 31st. They were to be renewed about ten days later, and will probably be completed ere these lines meet the eyes of our readers.

The Elastic Limit.

The opinion has at various times been emitted that straining a metal beyond its elastic limit injures it, but this appears to be untrue. It is not the mere straining of a metal beyond one elastic limit that injures it, but the straining, many times repeated, beyond its two elastic limits. Sir Benjamin Baker has shown that in bending a shell plate for a boiler the metal is necessarily strained beyond its elastic limit, so that stresses of as much as seven to 12 tons per square inch may obtain in it, as it comes from the rolls, and unless the plate is annealed these stresses will still exist after it has been built into the boiler. In such a case, however, when exposed to the additional stress due to the pressure inside the boiler, the over-strained portions of the plate will relieve themselves by stretching and taking a permanent set, so that probably after a year's working very little difference could be detected in the stresses in a plate built into the boiler as it came from the bending rolls, and in one which had been annealed, before riveting into place, and the first, in spite of its having been strained beyond its elastic limits, and not subsequently annealed, would be as strong as the other.

As another instance of the ideas very commonly prevailing, we may note that objection has been raised to the theory of wire gun construction in that it depends upon the assumption that the wire is not strained beyond its elastic limit, and that, as in the very process of being wound in place the wire must of necessity take a permanent set, the foundations of the theory are unstable, and that hence all the algebraic formulae for the tension of the wire are useless. This objection does not seem to us well founded. No doubt if the wire is wound on to the gun from another roller it is permanently deformed in the process, and owing to its elasticity, stresses of the nature of those due to bending will exist in it after being wound into place, and thus the ring tension will not be uniformly distributed over the section of the wire. As this wire is thin, however, these stresses should not be high, and as, moreover, the overstrained portions will be able to relieve themselves by a plastic yielding, if necessary, thus transferring part of their load to the neighboring understrained fibers, while the mean tension remains the same, there is no reason for supposing that this unequal distribution of stress over the section of the wire seriously affects the application of the formulas, or the validity of the theory on which these formulas are based. The conditions indeed are much the same as in the case of the boiler shell plate discussed above, and as experience proves that such boilers can be constructed successfully without annealing these plates, our conclusions as to the wire gun may be said to be confirmed by experience. The real objection to wire guns appears to be the want of longitudinal stiffness resulting in drooping of the muzzle, but this is a question not entering into the scope of this article.—*Engineering.*

THE TOOL AND HANDLE IN ONE PIECE.—The difficulty in making an effective, strong joint between a tool and its handle has long been felt, and the disadvantages thus involved are well understood, not only in respect to looseness in the joint but to the positive lack of power. But the invention of the Mannesmann process, for the production of tubes direct from metal blocks, would now appear to have rendered both possible and desirable the making of a tool combined with its handle; that is, by means of that process tubes are produced having solid portions at one or more points of their lengths, and these tubular rods may be made in any convenient lengths, with solid portions at regular or irregular distances apart, so that by cutting through such solid portions the rod can, of course, be divided up to a corresponding number of blanks for tools. By cutting such bars through at convenient points, as the size or length will show to be best, each section will consist of a hollow part, which may be suitably shaped or bent to form the handle, and the solid part, which can be shaped into the tool-head by forging or stamping. Various tools are so formed, and it is obvious that they possess a greater degree of strength and durability than tools of which the handles form a separate piece.

THE HOLDING POWER OF ANCHORS.—Extensive experiments are being carried out in England to determine the holding power of different kinds of anchors, and the experiments are to be made for the purpose of finding out which is best.

As manganese in cast iron increases beyond 50 per cent, the mass cracks in cooling; and when it approaches 93 per cent, the mass crumbles or falls to pieces.

SCIENTIFIC PROGRESS.

Lime, Limestone and Mortars.

With regard to the burning of limestone or carbonate of lime, pure carbonate of lime may be subjected to the intense heat of the oxyhydrogen blowpipe without losing its power of slaking when exposed to moist air, a fact but too well known to all who use the lime light. Even natural limestones of considerable purity, writes Walter F. Reid, can be exposed to the highest available temperatures without deterioration of the resulting hydrate; and I have myself exposed Buxton limestone to the intense white heat of a steel furnace, and subsequently found it to slake as well as the same stone burnt in the ordinary way. Should any of the limestone be insufficiently burnt, i. e., should it still retain its carbonic acid, it will not slake, and the lumps can easily be separated from that which has been converted into a fine powder by the slaking process. The use of wood for burning lime has the great advantage that it does not introduce the deleterious sulphur compounds present in all mineral fuels.

The interesting experiments of Wolters and other observers have clearly proved that the presence of carbonic acid is not necessary for the setting of mortars, and that mortars will set perfectly well in an atmosphere quite free from carbonic acid. No doubt the ultimate hardness of mortars is much increased by the gradual absorption of carbonic acid; but the process is extremely slow, and as it requires several generations for its completion, we must not rely on it for modern work.

Dr. Zurek found a considerable percentage of caustic lime 500 years old, and a sample of mortar from a bridge over the Great Western railway, which was removed last April, and was about 50 years old, still contained 27 per cent of the lime in a caustic state. Air slaked lime does not absorb carbonic acid unless free water is present; this has been known for 20 years, and yet some persons specify that lime shall be newly slaked.

This is in direct contradiction, both to the practice of the ancients and modern scientific observation.

There is a reason for the use of pulverized marble. Marble, even the finest particles, is crystalline in structure; and it is a fact well known to chemists, that a particle of crystalline substance will often produce crystallization when added to a mass of identical chemical composition, but amorphous in structure. It is, therefore, highly probable that the presence of these crystalline particles in mortar may cause the carbonate of lime, which is slowly formed, to assume the crystalline structure; and as this is the final and most permanent form of all mineral substances, the result is no doubt favorable as regards the permanence of the mortar.

With regard to the admixture of the glue with whitening, this could hardly be very desirable, but caustic lime would have a very different chemical action on the glue. I have used for many years for painting woodwork, out of doors, a mixture of blood and caustic lime, which mixture is much more desirable than a wash of lime or even Portland cement; and yet the blood alone is a very unstable substance.—*World's Progress.*

Insolubility of Pure Metals in Acids.

The results of an investigation concerning the cause of the insolubility of pure metals in acids are contributed by Dr. Weeren to the current number of the *Berichte*. De la Rive, so long ago as the year 1830, pointed out that chemically pure zinc is almost perfectly insoluble in dilute sulphuric acid. Dr. Weeren's theory of the phenomenon is as follows:

"Chemically pure zinc, and also many other metals in a state of purity, are insoluble in acids, because, at the moment of their introduction into the acid, they become surrounded by an atmosphere of condensed hydrogen, which, under normal circumstances, effectually protects the metal from further attack on the part of the acid."

The experiments from which this theory has been derived were briefly as follows: The amount of chemically pure zinc dissolved by the acid was first determined. It was next sought to determine what difference would be effected by performing the experiment *in vacuo*, when of course the escape of the hydrogen would be greatly facilitated. The solubility was found under these circumstances to be increased sevenfold. Next, the experiment was performed at the boiling temperature of the dilute acid, first when ebullition was prevented by increasing the pressure, and secondly when ebullition was unhindered. In the first case, when ebullition was prevented, the solubility was practically the same as in the cold; while in the second case, with uninterrupted ebullition, the solubility was increased 24 times. Finally, experiments were made to ascertain the effect of introducing into the acid a small quantity of an oxidizing agent, capable of converting the hydrogen film to water. When a little chromic acid was thus introduced the solubility was increased 175 times, and when hydrogen peroxide was employed the solubility was increased three hundredfold. The explanation of the ease with which the metal becomes attacked when the ordinary impurities are present, is that the hydrogen is not then liberated upon the surface of the zinc, but rather

ther upon the more electro-negative impurities, leaving the pure zinc itself open to the continued attack of the acid.

WEATHER SIGNS.—The formula of popular weather signs most approved by scientific men is that adopted by the farmers' Club of the American Institute some years ago: 1. When the temperature falls suddenly, a storm is forming south of you. 2. When the temperature rises suddenly, a storm is forming north of you. 3. The wind always blows from a region of fair weather toward a region where a storm is forming. 4. Cirrus clouds (curl-cloud, cat-tail) always move from a storm region toward a region of fair weather. 5. Cumulus clouds (hay-cook) always move from a region where a storm is forming. 6. When cirrus clouds are moving rapidly from the north or northeast, there will be rain within 24 hours, no matter how cold it is. 7. When cirrus clouds are moving rapidly from the south or southeast, there will be a cold hailstorm on the morrow, if it be in the summer, and if it be in the winter, there will be a snowstorm. 8. The wind always blows in a circle around a storm, and when it blows from the north the heaviest rain is east of you; if from the south, the heaviest is west; if from the east, the heaviest is south. 9. The wind never blows unless rain or snow is falling within 1000 miles of you. 10. Whenever heavy white frost occurs, a storm is forming within 1000 miles north or northwest of you. This is about as far as popular weather prophecy has yet advanced. It is not a great distance, but it is better than the old fashion of trusting to the italic warnings in the almanac, prepared a twelvemonth ahead. While clouds, especially the higher forms, have a general tendency to move in the same direction as storms, that is, from west to east, it has been decided that they are a very poor guide to follow in special instances, and they fail, especially at times when such assistance is the most needed.

COMPOSITION OF THE SUN.—Thousands of curious and ingenious theories have been brought forth to account for the fact that the sun, although he has whirled his burning disk across the heavens for untold ages, continues to burn without being consumed or his bulk being lessened in the least. Some learned men affect to believe that the great orb is a monstrous ball of gas, but even a great ball of gas would be consumed in its utmost atom in the course of a few thousand years. Others pretend to believe that its fires are kept up by the remains of wrecked worlds which are constantly falling into its depths, but even this seems far from probable, not to say a purely absurd conclusion. In giving his opinion on the last contention, one of the most eminent astronomers of the day has figured that a mountain range consisting of 176 Ohio miles, falling into the sun, would only be sufficient to maintain the present heat for a single second; a mass equal to that of our earth would engender only enough of heat to last 93 years. If these conclusions are correct, and we have no means of proving them false, well may we ask the question: Of what wonderful, indestructible substance is the sun composed?—*Boston Journal of Commerce.*

HAILSTORMS AND FORESTS.—A curious observation regarding hailstorms has been brought before the Swiss Geographical Society at Geneva by Herr Riniker, the chief forester of Aargau Canton. He maintains that hailstorms do not occur where there are forests, and cites the case of a small chain of mountains in the south Aargau, known as the "Lindenberg," which, in their normal state, are completely covered with trees. About 25 years ago, the forest was felled in two places, leaving wide gaps across the valleys and over the range and immediately afterward the valleys were visited by devastating hailstorms. Five or six years later the larger of the two gaps was planted with fir, and since that time not a single hailstorm has been reported in that portion of the range, or in the valley below, while further up, in the neighborhood of the other gap in the forest, they still occur every year. The Government is now considering the advisability of closing the gap and letting "Nature take its course."

POSSIBLE BIRTH OF THE MOON.—When the earth was young, says Dr. Baily, astronomer royal for Ireland, it spun round at such a rate that the day was only three hours long. The earth was liquid then, and as it revolved at that fearful speed the sun caused ever increasing tides upon its surface until at last it burst in two. The smaller part became the moon, which has been going around the earth ever since at an increasing distance. The influence of the moon now raises tides on the earth, and while there was any liquid to operate on in the moon, the earth heaped up much greater lunar tides.

A DANGEROUS LOCALITY.—There is a post at the corner of the public square in Fairmont, Mo., which gets a bolt of lightning from nearly every thunder storm that comes along. Three men, five horses, and 20 or 30 sheep have been electrocuted at the spot.

THE APPARENT FLATTENING OF THE VAULT OF THE HEAVENS has been found to have an annual period, and to depend on clouds. It seems least flat with a misty horizon, and less by night than by day.

ELECTRICITY.

Progress in Electric Street Railroads.

In Oakland, work is to be commenced within a few weeks on the electric road to run from Sixteenth and Grove streets, along Sixteenth street to Paralta, up Paralta to Seventeenth, and down Seventeenth to the Sixteenth street depot. This is the West Oakland branch of the Oakland Consolidated Street Railway Company. The contract for filling in a portion of marsh land on this road has already been let.

The Proposed Road from San Francisco to Half Moon Bay

Seems to be now in a fair way for realization. The Supervisors of San Mateo county granted the franchise some two weeks since. The franchise stipulates that the road shall be one section from Colma to Half Moon Bay. Work is to be commenced within six months and \$20,000 must be expended in work the first year. The road is to be completed inside of three years and cars running into Half Moon Bay, otherwise all work done on the road, together with material in use, to be forfeited to the county. The conditions in regard to the service of the proposed road are that cars shall be run every 60 minutes or oftener; fare from Half Moon Bay to San Francisco, 65 cents; freight, exclusive of butter, eggs, milk, etc., \$1.65 per ton from this side of the San Pedro, and \$1 from the other side. The company has 60 days option to accept the franchise on these conditions.

The San Mateo and San Francisco Road.

If no unforeseen delay intervenes, the running of cars on the line of the San Francisco and San Mateo Railway will begin on January 1st next. Track-laying over the entire route, from the foot of Market street to Baden, in this county, is finished, and all switches and crossings are in place, except that at Ocean View, which will be completed next week. The overhead wire, which will extend over the length of each track, is now being placed in position. The company has two sizes of cars, one style being 24 feet in length over all, and the other 30 feet. The middle portion of each style is the same. The motive power will be generated by two engines of 500-horse power each, and one of 250 horse power. All the engines are finished and awaiting the completion of the power-house.

The Haywards Electric Road.

This company has let the contract for a power-house, all the ties and poles have been purchased, plans for the machinery prepared, and contracts let for engines, boilers, etc. The power-house will be on the Warner tract, between Oakland and San Leandro. The delay in commencing the road has been caused by a difficulty in carrying out the negotiations for the rails. When they receive the rails work will commence.

Electric Street-Car Lines in Fresno.

The extensive system for street electric roads in Fresno seems to be rapidly taking shape. The local capitalists of that city are furthering the enterprise. The project contemplates about 12 miles of track, with many branches and feeders.

Electric Street Railroads for Walla Walla.

It is expected that Walla Walla's horse cars will soon be changed into an electric line, though whether the system adopted will be that of the trolley or overhead-wire system or some of the underground systems is not yet known. Superintendent Hill of the present-horse car system, is now in the East studying the various systems employed there. He is inclined toward the Woods system, which does away with the expensive overhead wire, and at the same time furnishes a system that can be cheaply put in operation, and is reasonably inexpensive to operate and perfectly safe in operation.

This New System

Is quite novel, and, if found practicable, will no doubt attract much attention. It employs a buried wire, a small exposure being made every six feet. The wire can be laid without disturbing an existing track, even the ties being unmolested. The cars gain power from the buried wire through small exposures, by means of long brushes, which are situated beneath the cars. By this means the entire wire, except the small portion beneath the traveling car, is dead and harmless. It is said that this system is very successful in actual operation. While he is East, Mr. Hill will pay particular attention to its workings, and if he finds it feasible, his street-car company will probably change this line immediately. His report will be looked for with much interest.

A Los Angeles Electric Road.

The Los Angeles Express says that the electric road on the Vernon route is now running cars from First and San Pedro streets through. In a few days the company will open the Los Angeles street line from San Pedro street to Aliso street. It is the intention of the company to connect this line with the East Los Angeles line when it is built, and trains will run from the East Los Angeles Park through to the Santa Fe track on Central avenue, a distance of over eight miles. The contract for the East Los Angeles division has been advertised, and will soon be let to contractors.

New Electrical Appliances.

Among the new applications of electricity noticed the past week, we have a device for an electric signal to prevent accidents to workmen engaged in repairing railroads, which consists of a portable electric battery, to which is connected a bell for giving notice of approaching trains. A soleplate and spring is attached to the side of the rail and the spring is depressed by the flanges of the passing wheels, closing the circuit and ringing the bell. As the workmen continue their work the wire is run out, so that it is possible to get everything from the track before the train reaches the spot. The inventor refuses to patent the invention, being desirous of having it universally adopted by the railroads of the world.

We have also a self-registering electrometer, operated by a photographic process, the invention of a San Francisco electrician. The instrument—without going into description—is an adjustment of the galvanometer to the camera. The needle of the galvanometer responds to the strength of the current, and its fluctuations from moment to moment vary with the amount of current used. As it is not practicable to have some one stand and record the needle's movements, this automatic arrangement has been made to keep a continuous and permanent record thereof. A sheet of sensitized paper slowly unrolls behind the needle, and the action of the light thereon, as shaded by the needle in its different inclinations, gives an accurate registration of its deviations, which represent the variations of the electrical current. Of course a register of this kind has to be kept always in a bright light, or the photographic process would not work.

An automatic telephone check is another valuable application of electricity. The present system of charges for the use of telephones by annual subscription is by many considered unjust, inasmuch as some subscribers speak often and much, whereas others use the telephone only occasionally. A device has been put in practice in Germany by which an electrically driven clock is attached to each telephone, which will work as long as the telephone is off the hook, and stops directly it is replaced. The service is charged for according to time recorded. It is claimed for this system that unnecessary conversations are prevented, that those that take place are limited to reasonable length, and the useful efficiency of the whole installation is increased.

Electric Lights.

The electric lights in Salinas were started up Sunday evening, Nov. 1st, but on account of the unsatisfactory working of the machinery, the lights were not up to the standard. The next night, however, everything was working finely, and the lamps showed a test of 10 per cent above the requirements. The arc system, supplemented by the incandescents, gives to Salinas a metropolitan air.—*Salinas Journal*.

The people of both Ukiah and Healdsburg are congratulating themselves on the immediate prospects of securing electric-light plants for each of these thriving towns. The Ukiah Democrat says that preliminary arrangements have already been made for a plant for that town. Two dynamos have been ordered and are on the way there. The power will probably be furnished either by the flour mill or the grist mill. The people of Ukiah are glad to see the work commence, and the indications are now all favorable for the town soon being lighted in a modern manner.

The Enterprise of Healdsburg says that Messrs. Gardner & Davidson have been in town interviewing the people with the idea of putting in an electric-light plant. The rates offered are reasonable, and it is to be hoped that sufficient patronage may be guaranteed to induce them to put a plant in. Electric lights are a great benefit to a city, and Healdsburg should secure them.

ENLARGEMENT OF THE HAYWARDS ELECTRIC-LIGHT PLANT.—The Haywards Journal says: A visit to the new quarters of our electric light company is well worth the trouble of our people. The new building, constructed of corrugated iron, is 70x32. The manner everything is finished inside and the way everything is arranged shows that the projectors had made a study of the improvements contemplated. We doubt if there is such a fine plant in the State. The power is generated by a new 175-horse power engine. The light is produced by two incandescent machines, each of 500 lights. The capacity of the plant is now three times its former size, and they can run three times as many lights as at present used, and also furnish the power for an electric road to Roberts' Landing. The cost of the new improvements was at least \$10,000.

LARGE DEMAND FOR ELECTRIC MINING MACHINERY.—A single electric machine manufacturing company in Pittsburgh has on hand at present orders enough to keep its works running full all through the fall and winter. The company is shipping its patent electric mining machines into Iowa, Missouri, Illinois, Colorado, Utah and Washington, and will shortly have completed a couple of machines for a mine in West Virginia. F. M. Lechner, the inventor and superintendent of the company, has recently made valuable improvements in electric mining machinery.

GOOD HEALTH.

Fish as Brain Food.

A writer in *Temple Bar*, an English publication, says: As a result of personal experience, I may state that some years since I lived for a period of 40 days, so far as what is called solid food is concerned, solely on fish, with, of course the addition of bread (no potatoes were eaten during the period); but I cannot recommend that mode of living. I discovered before the 40 days had expired that fish was not the stuff of life.

In the course of my experiment, I not only lost flesh, but also energy; nor did I feel my head clearer, or my thoughts and feelings more alert, than when subsisting on more varied food. While living upon fish only, one feels "a want," a craving for "something—you don't know what;" that is to say, you cannot give a name to your desires; nor does the feeling wear off as you continue the dietary; at all events, in my case, "custom came to the rescue;" so, after 40 days had expired, I returned to the flesh-pots, not all at once, though, being convinced that caution was necessary.

One popular fallacy in connection with fish may be noticed; namely, the oft-repeated assertion that the eating of that particular food increases brain-power. No one who has studied the subject can possibly believe the assertion. A man might eat a huge portion of fish every day of his life, and on the day of his death, if the quantity of phosphorus (the brain invigorator) consumed were to become visible, it would not amount to more than might probably suffice to tip a couple of loafers methebes. Communities have existed that lived almost solely on fish, but these lobythophagists were certainly not famous for intellectual attainments. Nor are our fisher villages, in many of which much fish is presumably consumed, the seats of any great amount of brain-power. None of our fisher-folks are remarkable for genius, or even what is called common sense; their views of life and its responsibilities being shrouded in a haze of superstition, which they lack sufficient strength of mind to see through.

No fishing community, so far as is known to the writer, has given to the world a great man. Men of mark—poets, preachers, lawyers, warriors, philosophers and physicians—have emanated, in Scotland at any rate, from all classes except the fishing class.

TERIBLE SLAVERY OF THE CIGARETTE HABIT.—I never fully appreciated the evil effects of the cigarette habit until a day or two ago, when I was called in to draw up the will of a man who won't live many days longer. The man who sent for me is a well-to-do merchant, who will leave behind something like \$200,000 when he goes. He has a son of 30 who is a confirmed cigarette fiend. The old gentleman told me that his son often smoked 100 cigarettes a day, and would not give up the practice, although his father offered him \$100,000 if he would do so. Under the will I drew up, he will get just 100 cents, if he ever lives to get that. He is the most wretched specimen of manhood I have ever seen, and is a man wasting away as rapidly as it is possible for a man to grow thin. He still keeps up an enormous consumption of the little paper cigars, and it is pitiful to hear him confess his lack of will-power. He knows what his father has done with his money, but doesn't seem to care. A legal friend of mine told me of another case of the same kind. An old lady of 70, who lives on Long Island, cut off her son with a few shillings for the very same reason. This young man consumes ten packages of cigarettes a day. A girl he wanted to marry refused him on that account, and now his mother will give her money to somebody else. He is indifferent to both actions, and still smokes cigarettes. He'll die soon, too.—*N. Y. Globe-Democrat*.

SUGGESTIONS ABOUT REST.—Dr. William A. Hammond makes some suggestions in the *North American Review* about how to rest, in which he intimates that change is only partial rest, and that the varying of occupations of the mind as the farmer rotates his crops will be advantageous, but allowing the mind to lie fallow occasionally, like the field, much better. "Men and women, like the fields of the earth, require change, and, like them, they require rest," says Dr. Hammond, with considerable pertinency; but he adds that "these objects can never be attained in the way that the average American sets out to get them." There is altogether too much truth in this comment. The idea of rest which the average American possesses is to pack a trunk and satchel in haste, jump on a train and jolt across half the continent, to stay a day or two at some fashionable resort and then jolt home again. There is change enough in such a jaunt, but no rest. If Horace Greeley were alive, he would tell the listening world that the way to rest is to rest. Dr. Hammond should have put it just that way, but he didn't.

THE FUEL OF THE FUTURE is a subject that is receiving a marked degree of attention, and from present indications it cannot be long before gas will entirely supersede solid fuel for household use in all situations where gas can be had.

TO POLISH DEER HORNS.—Scrub them with a brush and sand to take off the dirt and loose fiber, then polish with rouge and rotten stone and a cloth, and varnish with copal varnish.

USEFUL INFORMATION.

Color Testing of Flours.

The British National Association of Millers, at their recent annual convention, had the good fortune to hear an excellent paper on "The Investigation of the Color of Flour," by Mr. Joseph Lovibond, Mayor of Salisbury, but better known as the inventor of an instrument for accurately measuring and registering the color of flours, which he calls a tintometer.

Mr. Lovibond remarks that when a beam of light impinges on flour, a portion of the light is absorbed by the flour, and a portion only of the rays which constituted the impinging light being reflected to the eye, the color of the flour is really the color of the broken light which reaches the eye, and the particular color is dependent on the preponderance of certain color rays in the reflected light. This fact, as it possibly may have occurred to some of us, makes all the difference in the appearance of a flour, when shown respectively by a miller's traveler, who knows his business, and one who does not. In addition to peering the proffered sample on blue paper, a lot of difference can be made by a little manipulation according to surrounding objects.

In employing the well-known Pekar test, by which the flour is pressed and then dipped in water, the difference of pressure, time and method of immersion in water, the time of exposure before examining, and the dryness of the atmosphere during exposure, all have an influence on the character of the color developed. As uniformity is therefore necessary, the flour could conveniently be always pressed into half its original bulk, should be immersed and withdrawn four times, occupying a total of eight seconds; should then be placed obliquely, so as to drain for 30 minutes before examining. Where the extreme accuracy necessary in keeping a record of colors was not required, it would be found sufficient to take but ordinary care, and to examine when dry, on the next morning. Flours on being kept, bleach.

The color of a flour does not depend on the starch, but on the gluten; color should, therefore, indicate the quantity and also quality of the latter, and thereby be relied upon to show the market value of a flour to a much greater extent than the inexperienced observer usually attaches to it. With a little experience we should be able to anticipate by means of the color of flour, more than the color of the bread. We know that it is not always the whitest flour that makes the whitest bread, but although we know we must have strength in a flour so as to make it carry its color into the bread, we do not always take the different degrees and character of color to be a sufficiently good criterion of strength and other qualities.

VARIOUS USES OF EGGS.—It is an error to suppose that eggs have no considerable use except for food. They are employed in calico printing, in photography, in gilding, in clarifying various liquors and in bookbinding. A large business has sprung up in the preparation of photographic paper with selted albumen, and one establishment alone is said to have made more than two million eggs in six months for this purpose. Many attempts have been made to find a vegetable or animal substitute for albumen, but in vain. A prize of \$2000, offered 30 years ago by an English society for the discovery of a material or process of replacing albumen in calico printing, still remains untaken. Nor are the yolks of eggs used in manufacturing, wholly wasted. They are also employed in the arts, and a manufacturer in Vienna solidifies them. Possibly, too, the development in canning will before long give us canned eggs, or perhaps condensed eggs, suitable at least for cooking. At any rate, it would seem worth while to raise part of the eggs which are consumed by other countries.—*Bradstreet's*.

TO MAKE SKELETON LEAVES, soak in rain water for some weeks, remove by floating upon a card, and very gently remove upper skin, with a soft camel's hair brush. Float in water and catch on a card with the other side uppermost, and remove other skin and pulp. A stiff brush may be needed, to be used by dabbing. Do not touch with finger. Finally wash well, bleach with javelle water, wash and dry.

AVERAGE PRICE OF WAGES.—Based upon the estimates furnished by the superintendent of the census bureau, the average wages of laborers in the manufacturing industries of the United States are a few cents less than \$411 each. Taking into consideration the large proportion of women, children and unskilled that are employed, and this is not a very bad showing for American labor.

Numerous experiments have demonstrated that iron or steel, when magnetized, undergoes a change in form caused in the magnetic conditions of the molecules, which causes their elongation or contraction.

GRAVEL WALKS in gardens and shaded places are frequently covered with an unsightly growth of moss. This can be effectually prevented by watering the walks with a solution of sulphate of copper (blue vitriol).

When Herschel studied astronomy only four double stars were known. Now nearly 7,000 of them are distinguishable.

Passing Events.

The Mining Congress is now in session in Denver, and a brief report of the preliminary proceedings is published in another column. Fuller reports will follow. A number of delegates have gone on from this State to represent our interests.

A Miners' Convention is proposed in this State, the main object of which will be an interchange of views as to the best method of bringing about a resumption of hydraulic mining. Placer county is taking the lead in the initiatory steps. Congress is to be memorialized as to the needed legislation.

Were coal ordinarily as abundant in San Francisco as at the present time, our manufacturing interests would greatly increase in number and extent. The greatest drawback locally, to manufacturing industries is lack of good, cheap fuel.

The American Society of Mechanical Engineers, now in session in New York, has decided to hold its May meeting in this city. The local mechanical engineers are making preparations to receive and entertain the visitors.

The International League of Press Clubs will meet in this city in January next. The San Francisco Press Club will entertain the visitors.

Business Outlook.

As the year draws to a close, evidence is not wanting to confirm the prevailing opinion that the incoming year will be the most prosperous that has been enjoyed for years past. This opinion is grounded on the good crops secured and good prices realized by California farmers, together with more attention being given to mining.

Taking the crops in the rough and estimating the money received for them at the average prices for the season, and we obtain the following: For wheat, \$45,000,000; barley, \$10,000,000; other cereals, \$5,000,000; hay, \$12,000,000; potatoes, onions and other vegetables, \$4,500,000; beans, \$1,000,000; total, \$77,500,000. To this can be added at least \$3,500,000 for butter, cheese, eggs, etc., making a grand total of \$81,000,000.

Turning to fruit, we find the returns are very large. They are estimated as follows: Citrus and deciduous marketed green, \$4,500,000, marketed dried, \$5,000,000; raisins \$4,000,000; canned fruits \$3,500,000. Total, \$17,000,000, and when to this is added wine and brandy the aggregate will go well into \$20,000,000.

With the money returns from farm products going over \$100,000,000, we begin to realize that we have entered on a season of unexampled prosperity, for with so much money disbursed for products that have given good profits, money will not only be easy but seeking new avenues for employment.

The good results of large crops and profitable sales are witnessed in renewed railroad construction in various parts of the State, and also in more general activity among iron-workers than has been reported for some time. The activity among iron-workers and machinists, in general, is largely stimulated by the low prices ruling for iron and coal, which places them on more of an even footing with similar industries at the East, which admits of their successful bidding for work. The industry is also deriving considerable more business from the mining industry on this coast, which appears to be coming prominently to the front by reason of more money, both foreign and domestic, seeking investment in quartz mines.

The Mechanical Engineers.

The American Society of Mechanical Engineers, on Monday decided at its meeting in New York to convene in San Francisco next May. A local committee has been at work some weeks in expectation of this decision, and a dispatch of welcome has been forwarded to the Society in New York, assuring the members of the necessary arrangements being made here.

The American Society of Mechanical Engineers is growing at a very rapid rate. Its first catalogue, issued in 1880, showed a total membership of 189, and it has grown since that date at an average rate of about 100 members per year, so that its total membership is now over 1200, over 1000 of whom are regular members, and the others honorary, associate or junior members. Members are all elected by letter ballot, after having been recommended by five proposers or secondors, and their letters of recommendation scrutinized by the council. Seven black balls in the letter ballots are sufficient to exclude a candidate. The society is making efforts to extinguish the indebtedness on its building, No. 12 West Thirty-first street, New York, and a circular letter was recently sent to all the members asking how they would vote on the question of increasing the dues from \$10, the present figure, to \$15 per year. The replies were eight to one in favor of the proposed increase, which indicates that the membership consider that they are getting more than the worth of their annual dues in the benefits received from membership. A letter ballot has just been sent out containing the names of 62 candidates for full membership and 27 for junior membership. Among the candidates for full membership were three distinguished mechanical engineers of this city. It is expected that Irving M. Scott will be elected vice-president at the present session.

We published two weeks ago the names of the local committee in this city. At the meeting on Wednesday, Mr. W. R. Eckert presided and Mr. C. G. Yale (of the MINING AND SCIENTIFIC PRESS) acted as Secretary. The chairman and the president of the Technical Society, Mr.

Jno. Richards, are to select a Finance and Executive Committee, who are in turn to select the sub-committee to perfect the arrangements for the entertainment of the society, when it visits San Francisco.

Now that the society has decided to come, those in this city interested in mechanical engineering will have to take an active interest in the matter. A number have already signified their willingness to co-operate, but there are many others who have as yet made no response. The committee will make a thorough canvass for funds and lay out a plan by which whatever there is of interest may be seen by the visitors. On the way it is expected they will stop at Virginia City, but most of the time will be spent in the vicinity of San Francisco.

Electric Lights for the Eternal City.

A late English paper furnishes an account of an electric plant recently installed near Rome, Italy, which is of interest in this country, as showing the endorsement given by foreign engineers to one of our most prominent California inventions—the Pelton water-wheel—as well as their confidence in the high voltage method of electric transmission, now being so successfully demonstrated at the Frankfort Exposition.

One of the finest examples in Europe of water-power utilization in connection with alternating currents is the new electric station now being established at Tivoli, near Rome. As is well known, there is at this place a large and valuable water-power, a portion of which has recently been utilized in the establishment of a large alternating current station of a capacity of 2000-horse power intended to supply a portion of the city of Rome with electric light.

Water is taken from the Falls of Tivoli by an aqueduct from which a pipe-line 1.6 of a meter, 62 inches in diameter is run to the wheel station. The entire fall is 48 meters, 156 feet, and the water supply 3 cubic meters, 106 cubic feet per second. The power station consists of three 100-horse power Pelton wheels which operate direct current dynamos used as exciters, also six Pelton wheels coupled direct to the same number of 350-horse power alternators which run at 5000 volts pressure and 45 amperes.

The wheels are governed by hydraulic inlet valves, which are worked by a sensitive hydraulic relay set in operation by a centrifugal governor. By this means the speed is automatically kept constant independent of the working of the machine.

The alternating current so generated is to be transmitted to Rome, a distance of 25 kilometers—15½ miles—by means of four-stranded copper cables, each being 100 square millimeters—15 square inches—in cross-section, and capable of carrying 120 amperes carried overhead on iron poles placed 35 meters—114 feet—apart, and about 30 feet high, insulated by means of double-shed oil insulators specially designed for this work by Professor Mengarini.

A drop of 1000 volts, or 20 per cent, is to be allowed in these lines. At the far end of the trunk mains the pressure will be reduced by step-down transformers to 2000 volts, and distributed underground by Siemens cables to secondary centers, at which it will again be reduced to 100 volts. The six machines are all capable of being worked together in parallel, the maximum number of five being used together, one machine being always in reserve. Two of the exciters are sufficient to supply exciting current to the whole of the dynamos, the third being a reserve.

It is stated that Senator Stanford has decided to erect a handsome suburban hotel building, to cost over \$100,000, near the main entrance to the grounds of the Leland Stanford Jr. University at Palo Alto, Santa Clara county.

The Sacramento county supervisors, who visited Iowa Hill, Placer Co., to see if it were advisable to let the miners there clean up bed rock, have decided that they have no power to grant the permission asked.

ALUMINIUM.—A consignment of some 300 pounds of bar aluminium has just arrived in this city from Germany, and may be seen at the office of Wm. Lichtenburg, 321 Market St.

Copper.

There is to be noted a great increase in the demand for electrolytic copper, with the active extension of electric lighting and railways, both here and abroad. During the past month there has also been a revival in the demand for sulphate of copper, which had remained dormant for the previous six months, during which most of the foreign works have been closed in consequence of the very large stocks carried over from last year, when the selling price left a very large profit on its manufacture, causing an excessive production. To this cause is largely due the excessive deliveries of copper last year and the falling off this year. The estimated production of 1890 in England and on the continent was 75,000 tons of sulphate, but it will probably not amount to 15,000 tons in all this year. This difference of 60,000 tons represents reduced deliveries of 15,000 tons of copper in those markets this year.

James Lewis & Sons of Liverpool, in their report on copper for the month, say: "An arrangement between the chief American mining companies, now represented by five or six different individuals or firms, for the regulation of their production in accordance with the home and European consumption, appears very probable. It is at last recognized that producers outside of the United States need not be considered, as higher or lower prices are found by experience to have little or no effect upon the extent of their production, which continues very much the same whether copper is at £40 or £60 per ton. Such action would be very beneficial to smelters and manufacturers, as it would give steadiness to values and largely stop speculation in this metal which so disorganizes the trade—generally for stock exchange purposes.

The Messrs. Lewis consider that the recent fall in values of copper seem in no way justified by the actual position of the metal. In March last, before the Anaconda mine was closed, the stock of copper in England and France was 57,381 tons and the value about £52 10s., while the present stock is 51,381 and the value £46 5s. per ton. In addition to this, the stock in the United States is stated to be reduced fully one-half.

New Gold-Saving Apparatus.

John H. Hohart of this city has patented through the MINING AND SCIENTIFIC PRESS Patent Agency a novel arrangement of amalgamating or copper plates intended more particularly for saving float gold, but adapted for ordinary gold-saving. The arrangement is such that barriers or impediments are formed in the course of the pulp, causing a whirling or adding of the flowing material, very advantageous for the catching of the precious particles.

The tailings with water are passed from the feed-chute into a hopper and fall through a screen on to an amalgamating plate, where some of the gold is caught. The sluice is set at an angle of about 45 degrees, and within this is a series of copper plates. These extend across the sluice transversely, and meet its bottom at an angle, said plates, on account of the inclination of the sluice, being approximately on a horizontal plane, or having a slight rise therefrom. They extend upwardly toward the cover of the sluice, but terminate short thereof, leaving a space above. A series of amalgamating plates are placed above these other plates, extending along the top of the sluice, while the lower portion extends downward across the sluice. Along the bottom of the sluice is another series of plates.

The tailings (or pulp), after passing into the sluice, meet the first inclined plate, are checked in their rapid flow and directed upwardly and outwardly against the upper side of the other copper plate. At this point, in trying to pass around the upper end of the plate, a whirl or eddy is created throwing the precious particles in perfect contact with the plates. This goes on through the whole series where the same action takes place. Baffle plates and guard plates are suitably placed to prevent injury to the amalgamating plates, and there is a transverse V-slucio at the end of the main sluice to catch any particles of quicksilver.

WHEN Herschel studied astronomy only four double stars were known. Now nearly 7,000 of them are distinguishable.

Hydraulic Hauling Machine.

This machine is the invention of Mr. W. Barton, mining manager of the North Bend and Barton Company, Ballarat, at which mine it has been successfully worked for some time. The cost of the present machine, inclusive of a steel wire rope, and erection of same, is £35. The cost of sinking 100 feet with machine, was £2 11s. 7d. per foot. The cost of sinking 100 feet with the windlass and manual labor, was £4 14s. 9d. per foot. Both tests were made through the same character of country by the same men, using the same blasting material, viz., "rack-a-rook," both done by wages men at 8s. 4d. per shift of six hours. The saving to

rate of 300 feet per minute. The machine is capable of being made to lift 2000 pounds at an increased pressure. For shaft sinking, an ordinary pressure of 100 to 200 feet head of water is sufficient to raise 320 pounds to 640 pounds respectively. The main feature of this machine is its safety, it being impossible to overwind with it. Its steadiness and silent action are improvements on the air winch, besides a saving of 50 per cent in cost over same, not to mention the cost of the generality of air.

Blasting in Coal.

No question connected with the actual working of mines is deserving of more atten-

also five new batteries, with a combined capacity of 10,000 horse power. The engine specially designed for the new mill is a very powerful condensing Corliss.

The Mining Congress in Session.

Most of the delegates from this State to the Mining Congress at Denver went on last week. The following were the delegates appointed by the Governor: J. Garvey, San Diego; J. W. Conant and Wm. P. Milter, Shasta; W. K. Addeley, Napa; H. H. Boomer, San Francisco; J. Niles Searle, Nevada City; C. E. Clinch, Grass Valley; R. McMurray, San Juan; Mellville Attwood, Nevada County, and Wm. Ire-

of peace? Why should times be worse than at any other time in the century? The want of money was the cause.

Secretary Sherman, the Senator said, after a visit to England and a conference with the goldbugs, had returned home and surreptitiously incorporated in a bill a clause rejecting silver. If this had been done to gold, it would not be worth 25 cents on the dollar. If it was not used for money, it would have no commercial value. But silver was universally circulated. It could not be destroyed, but it could be depreciated. There was no surplus bullion in the world previous to 1890. The entire product was used for commercial purposes. Great Britain was constantly selling silver short. The interest payments of that nation were \$80,000,000 annually, and were derived from the sale of silver. When silver went up last year, England sold twice as much as the requirements of the nation demanded, and they would do this so long as silver remained a commodity. He protested against the long dollar. The country was being robbed, the middleman was growing rich, and the producer growing poorer. Because they made a long dollar, enough dollars couldn't be found to pay debts; hence stagnation and hard times.

Needle System

Barrel System

NEEDLE AND BARREL METHODS OF BLASTING IN COAL.

the company in wages alone has amounted to several hundreds of pounds, due principally to the rapidity of hauling by the machine. Inasmuch as the men are able to get the debris and water away quicker, they have more time for boring. The water used by the machine is conserved in a dam 100 feet above the level the machine worked, and conducted down to the motor, through 3 inch pipes in the pump shaft, the company having no pumps. Mr. Barton states that any company with pumps in their shaft may obtain, by inserting a 2-inch pipe in column at the level where the machine is set, all the power they require at less expense than where a dam has to be used.

Hydraulic winch consists of a working drum 20 inches diameter, 14 inches wide, the lower or power drum 8 inches diameter, 16 inches

tion than that of the different methods adopted in blasting. The systems invented for charging and firing holes, having for their objects a certainty of explosion and diminution of danger, are of special interest to the working miner. In the coal mines of Illinois and other Central States, two methods of blasting are commonly practiced, one known as the needle method and the other as the barrel method. The needle method is the one prescribed by law in Illinois, but despite this, the barrel method is largely used, by reason of several advantages. The latter requires less time and less skill than the needle method. The two methods of loading the holes are plainly illustrated in the accompanying sketches.

IMPORTANT MINING DECISION.—In the case of the Waterloo Mining Company, grantee of

lan Jr. and F. M. Pixley, delegate at large. For San Francisco Mayor Sanderson has named as representatives William Ireland Jr., Ross E. Browne, Louis Janin, A. J. Bowle, T. C. Howell, A. B. Paul and John Finlay. Mr. Attwood was unable to attend.

The Congress opened on Wednesday of this week, when the El Dorado Mining Stock Exchange was dedicated. There was a street parade in which the miners and all interested in mining took part. There were also floats bearing mining machinery in motion and a great many tableaux indicative of the important features of mining. At the dedication speeches were made by President Taylor of the Mining Exchange, Mayor Rogers of Denver, and others. All the speakers advocated the free and unlimited coinage of silver.

Our Coal Supply.

For once our local markets are overtaken with coal, and many thousand more tons are on the way. The arrival of the grain fleet, nearly all coal laden, to this port has brought in an immense quantity.

The abundant supplies of foreign and domestic coal in this port have had the effect of sending freight for coasting coaliers down too low to make voyage payable, and as a result many vessels that have engaged in this trade will have to go to Oakland creek for a while. It was the foreign shipments that did the crowding, causing the price of coal to elude and the Coast mines to restrict their output. All varieties of coal are cheaper at present than they have been for a long time.

Up to the end of October, the total deliveries of coal in port were 1,133,120 tons, as against 833,820 tons at a corresponding period last year. Of this, 41,000 tons came from Australia and 44,200 tons from British Columbia. The low freights at present ruling for cargoes of coal from Coast mines have had the effect of putting the steamers Haytian Republic and Lakme into grain-hauling purview from Oregon to this port. Coal freights have dropped 50

PATENT HYDRAULIC HAULING MACHINE.

wide, driving wheels geared 5½ to 1 being equal to 13½ powers, two cast-iron stands 3 feet high to carry same. There is also a compound lever brake attached to same 12 inches diameter; this is used only in case of accident. The motor for working same consists of an ordinary barrel 9 feet in length, 11½ inches diameter, with a cover and stuffing-box at one end only. Power taken in by the ordinary tap, and reversed by the lower or untied tap. The piston-rod is composed of 2-inch iron turned up, 11 feet long, with hole in end to take shackle. The piston is formed of two separate castings, the lower form to hold the bucket being turned up in the lathe; the upper form keeps the leather in position. The whole is held together by a 1½-inch nut. The cost of bucket leather is 1s. per week. The hauling was done previously by a ½ inch Lowmoor iron cable; but this has been changed for a steel wire rope, six strands, 19 wires to each strand; total draught strain at 43 pounds to square inch, 4429 pounds, capable of lifting 320 pounds a distance of 120 feet in height at the

the Silver King Quartz Company, entry for which was made by Charles F. Bradley and others against John S. Doe, the Secretary of the Interior has affirmed the decision of the Commissioner of the General Land Office against the protestants who claimed that the mine was merely an extension from the vein or ledge of the Silver King mine. The claim in controversy was located in the Calico mining district, San Bernardino county, by J. J. Alleen, and after several transfers finally conveyed to Doe.

A CABLE FOR MISSION STREET.—Secretary J. L. Willontt of the City Railroad Company, which is a branch of the Market street system, announces that the horse-car line on Mission street from the ferry to the terminus will be changed to a cable road next year. The work of digging a cable trench has been begun at the easterly end of the line.

IMPROVING THE PLANT.—The Pacific Rolling Mills has recently put up a hydraulic mill that will roll beams of steel up to 20 inches square,

In the afternoon the Mining Congress opened at the People's Theater with ex-Governor Tabor in the chair. Delegates from 33 States and Territories reported, and it was understood that Hon. Niles Searles, formerly Chief Justice of California, would be elected permanent chairman. The recommendation has not yet been reported.

The greater part of the session was occupied by Senator Stewart of Nevada, who delivered a long address upon the silver question. He urged the Congress to adopt resolutions that would compel the National House of Representatives to pass laws restoring silver to a parity with gold. Resolutions favoring the coinage of the American product only, the Senator said, would not obtain 20 votes in the assembly. The gold ring has repudiated silver, and they have reduced the value of commercial paper to the narrow limits of gold. As a consequence, the farmers are growing poorer, and the history of bank failures showed their circulation was not enough to keep the banks in reserve funds. Why should there be hard times with 20 years

cents per ton within the last month and are now below \$2, at which figure even steamers of enormous capacity can do little more than pay expenses.

At present prices, it is said that the Southern Pacific Co. finds it cheaper to buy coal than to mine it, and if the railroad coal steamers tie up on this account, the outlook for freighters with over 47,000 tons of coal afloat and to arrive from Newcastle, Australia, alone, is not very bright. However, this great supply of cheap coal is good for manufacturers and domestic consumers, whatever may be the prospects for the dealers.

MINERS' HOSPITAL.—The preliminary arrangements have been completed for a Miners' Home, or hospital, at Shasta. The scheme originated with Dr. Stevenson, so we understand, and will be conducted on the same plan as the railroad hospital at Sacramento. Every miner or millman who will contribute \$1 per month will be entitled to attendance at this hospital.

A New and Splendid Technical Treatise.
The Manufacture of
VINEGAR AND ACETATES,
CIDER, AND FRUIT-WINES;
Preservation of Fruits
and Vegetables.

A Practical Treatise on the Manufacture of Vinegar and Acetates, Cider and Fruit-Wines; Preservation of Fruits and Vegetables by Canning and Evaporation; Preparation of Fruit-Butters, Jellies, Marmalades, Catchups, Pickles, Mustards, etc. Edited from various sources by Wm. T. Brandt, one of the Editors of "The Techno-Chemical Receipt Book." Illustrated by 79 engravings. In one volume, 8vo, 479 pages.

Price \$5.00, by mail, free of postage to any address in the world.

CONTENTS.—PART I. The Manufacture of Vinegar. CHAPTER I. Introduction. II. Theory of the Formation of Vinegar. III. The Vinegar Ferment and its Conditions of Life. IV. Products of Acetous Fermentation. V. Methods of Fabrication of Vinegar. VI. Quick Process of Fabrication of Vinegar. VII. Arrangement of a Vinegar Factory. VIII. Artificial Ventilation of the Vinegar Generators. IX. Automatic Vinegar Apparatus. X. Operations in a Vinegar Factory. XI. Preparation of the Alcoholic Liquid. XII. Execution of the Work in a Vinegar Factory. XIII. Disturbing Influences in the Fabrication of Vinegar. XIV. Method of the Fabrication of Vinegar in Apparatus of Special Construction. XV. Further Treatment of Freshly Prepared Vinegar. XVI. Preparation of Vinegar from Various Materials. XVII. Preparation of Vinegar Specialties. XVIII. Fabrication of Wine Vinegar. XIX. Chemical Examination of the Raw Materials and Control of the Operation in a Vinegar Factory. XX. Examination of Vinegar as to the Presence of Foreign Acids and of Metals, as well as to its Derivation. XXI. Manufacture of Wood Vinegar. XXII. Preparation of Pure Concentrated Acetic Acid. XXIII. Acetates and their Manufacture.

PART II. Manufactures of Ciders, Fruit-Wines, etc. CHAPTER XXIV. Introduction. XXV. Fruits and their Composition. XXVI. Practice of the Preparation of Cider and Fruit-Wines. XXVII. Cider from Apples and Pears. XXVIII. Fruit-Wines; a, from Small Fruits; b, from Stone Fruits.

PART III. Canning and Evaporating of Fruit, Manufacture of Catchups, Fruit-Butters, Marmalades, Jellies, Pickles, and Mustards. CHAPTER XXIX. Preservation of Fruit. XXX. Evaporation of Fruit. XXXI. Preparation of Pickles and Mustards. Appendix of XVI Tables. Index.

An illustrated circular of 6 pages, 4to, giving the full Table of Contents of this volume, will be sent free of postage to any one in any part of the world who will apply by letter.

Our New and Revised Descriptive Catalogue of Practical and Scientific Books, 88 pages, 8vo. A list of Books on Distillation and Rectification of Liquors, Brewing and Fermentation, Wines, Sugar, Starch, etc., as well as a circular showing the full Table of Contents of "The Techno-Chemical Receipt Book," sent free of postage to any one in any part of the world who will furnish his address.

ROPER'S
Practical Handy Books for Engineers & Firemen

By STEPHEN ROPER, Engineer.

The Engineer's Handy Book, containing a full explanation of the Steam Engine Indicator, and its use and advantages to engineers and steam users, with formulae for estimating the power of all classes of Steam Engines. Price.....\$3.50

The Young Engineer's Own Book. Containing an Explanation of the Principles and Theories on which the Steam Engine as a Prime Mover is based. Price.....\$3.00

Questions and Answers for Engineers. This little book contains all the questions that Engineers will be asked when undergoing an examination. Price, \$3.00

Handbook of Modern Steam Fire Engines. The only book of the kind ever published. Price, \$3.50

Catechism on High Pressure, or Non-Condensing Steam Engines. Price.....\$2.00

Care and Management of the Steam Boiler. Price.....\$2.00

Handbook of Land and Marine Engines. Price.....\$3.50

Handbook of the Locomotive. Price.....\$2.50

Use and Abuse of the Steam Boiler. Price.....\$2.00

Instructions and Suggestions for Engineers and Firemen. Price.....\$2.00

These books embrace all branches of Steam Engineering—Stationary, Locomotive, Fire and Marine. Any Engineer who wishes to be well informed in all the duties of his calling should provide himself with a full set.

JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimate furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbine for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Nov. 19, 1891.

Business continues fairly active. The backwardness of the rainy season is generally accepted as favorable to a large seedling and a good crop season. Money, while in fair demand, is by no means working close. Large disbursements are being steadily made on wheat and other farm products. It now looks as if the usual annual settlements will be made this year with more ease than for several years past. Late mail advices received from New York are as follows:

After temporary stringency caused by the shipment of several million dollars to Boston, money is easier, sterling exchange is reduced, railroad earnings reflect the large amount of grain in transit, of which further evidence is had in the advanced lake rates from Chicago to Buffalo, and additional amounts of gold were ordered from Europe. The total gold imports since Sept. 12 have been \$23,900,000, and about \$2,000,000 is known to be on the way. From Jan. 1 to Nov. 7 the exports of gold amounted to \$75,823,584, and the imports to \$24,935,643.

Another indication of much significance is the revived export movement of cereals, and this, despite higher prices in this market and advanced ocean freights. A leading grain firm reports large purchases at primary and seaboard markets. European buyers continue taking freight room for months ahead. It is reported their charters for the coming four months for all kinds of grain equal nearly 70,000,000 bushels.

MEXICAN DOLLARS—The last outgoing steamer for China took out \$423,225 for Hongkong and \$60,000 for Yokohama. The market hangs around about 74 1/2 cts.

QUICKSILVER—Receipts the past week aggregate 243 flasks. Shipments overland in last month aggregate 100 flasks. For the first ten months of the calendar year receipts at this point aggregate 11,680 flasks, while the shipments by sea aggregate 3888 flasks. The market holds strong at pool quotations.

SILVER—The address of St. Johns in favor of the free coinage of silver at the Bankers' Convention held at New Orleans, and the letter of Secretary Foster on the silver problem, written to same convention, and his addresses on the same subject before the New York Chamber of Commerce, are forcing the question to the front. The Mining Congress in session at Denver will also discuss the present situation. Notwithstanding the general discussion and apparently more favorable consideration of silver, there is a growing belief that we will not secure free coinage legislation until after the next Presidential election. Those in position to know say that there is a powerful monied clique at the East and abroad that is making a strong fight against bimetalism owing to the present position of silver being more favorable to speculation than if the metal was placed on the same footing with gold.

BORAX—Overland shipments in last month aggregate 440,770 cts. The market is steady at pool quotations.

LIME—Receipts the past week aggregate 2778 hhls. The market is quiet but steady.

ANTIMONY—The market is quiet but firm.

LEAD—The market at the East, after passing through several weeks of strong depression, appears to be gaining in activity, with better prices obtainable. In our market, trading is dull but steady.

TIN—The local market is very dull, with prices favoring buyers. The consumption this year was disappointing, owing to fruit-canners not taking as much as was expected. *Iron Age*, Nov. 18, reports the New York market as follows: Estimates of spot stocks of pig vary considerably, some placing the total at less than 1700 tons and others making it upward of 2000 tons. That the holdings are weighty there is no doubt, however, and so strong is the conviction that 2000 tons does not overestimate the quantity that some operators still refrain from covering the November "puts." The consumptive and trade demand is merely fair and met at prices very close to those that figure in the speculative dealings. Tin plate is dull and heavy. London cables, Nov. 18th, report an inactive market for both pig and plate.

COPPER—The market continues to settle. London cables report that weak holders are about closed out. New York mail advices to Nov. 12, report as follows: Returns from 14 Lake Superior mines show an increase of over 4000 tons in the output during the past ten months; Montana is said to make a pseudo phenomenal showing also, and the uncertainty as to what Anaconda may do serves to complicate matters. Meanwhile home consumers manifest what may be termed supreme indifference and the situation in Europe is by no means assuring.

IRON—The market shows a fairly firm tone under a free consumption, and it being reported that the free imports are cared for. English advices report a steady, firm tone, but at the East the market is far from satisfactory to the selling interests.

COAL—Imports the past week aggregate as follows: Baltimore, 3000 tons; Departure Bay, 6543; Newcastle, N. S. W., 11,627; Sydney, 3079; Hull, 1851; Comox, 4530; Cardiff, 3900; Liverpool, 7775; Tacoma, 1900; Seattle, 3555. Total, 47,680 tons. The spot market near by cargoes continue in buyers' favor, but distant cargoes and cargoes for shipment have a firm tone, with prices asked above the parity of this market. The break in charter at this port makes it difficult to secure vessels, except at quite an advance for loading at Australian or English ports for San Francisco or San Diego. It is said that the output of the coast mines is being regulated to suit the demand.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

BACK FILES OF THE MINING AND SCIENTIFIC PRESS (unbound) can be had for \$5 per volume of six months. Per year (two volumes) \$8. Inserted in Dewey's patent binder, 50 cents additional per volume.

Assessment Notices.

GRANVILLE VINEYARD COMPANY.—LOCATION of principal place of business, San Francisco, California. Location of works, Hanford, Tulare County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of November, 1891, an assessment, No. 4, of \$4.00 per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, 111 Front Street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 18th day of December, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of January, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors. CHAS. MERSELDER, Secretary. Office, 111 Front Street, San Francisco, California.

CALIFORNIA VERDE ANTIQUE MARBLE COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of November, 1891, an assessment (No. 1) of One (1) Cent per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, 308 Pine Street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 18th day of December, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of December, 1891, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors. W. J. GURNETT, Secretary. Office, 308 Pine Street, San Francisco, California.

GRAY EAGLE MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of October, 1891, an assessment, No. 25, of Four (4) Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 18th day of November, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of December, 1891, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors. A. W. BARROWS, Secretary. Office, Room 11, No. 303 California Street, San Francisco, California.

CALIFORNIA CREAMERY COMPANY.—LOCATION of principal place of business, San Francisco, California. Location of works, Novato, Marin County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 24 day of November, 1891, an assessment, No. 1, of Forty (40) Dollars per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, 111 Front Street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 18th day of December, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of January, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Directors. CHAS. MERSELDER, Secretary. Office, 111 Front Street, San Francisco, California.

402 FRONT ST., SAN FRANCISCO.

WINANS' ANTI-INCORUSTATION POWDER OR BOILER COMPOUND.</

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents,
220 Market St., Elevator, 12 Front St., S. F.
TELEPHONE NO. 658.

BELTING.**SHEET IRON PIPE****IRON PIPE**

ALL SIZES, FOR GAS, STEAM AND WATER.

— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES.

For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed Charcoal iron of great tensile strength. The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, BITUM and PETROLEUM, at a Temperature of 300° Fahrenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

CORRUGATED

CORRUGATED IRON,

Black, Painted and Galvanized, for Roof and Sides of

HAY BARNs, DRY HOUSES, STABLES, ETC.

W. W. MONTAGUE & CO.

SAN FRANCISCO—SAN JOSE—LOS ANGELES.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of those belts are the same as is used on the Erie or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880

September 18, 1883; July 24, 1888;

and March 31, 1891.

AMERICAN BALANCE VALVE FOR LOCOMOTIVES.

The American Balance Slide Valve.

The American balance slide valve is a Pacific Coast invention, and consists simply of two pieces. There is a cast-iron snap ring, with its inner face beveled, to fit over and against a conical disk, which is placed on top of the valve, as shown in the sectional cut; or the conical disk may be cast as part of the valve. When the steam-chest cover is placed in position, it forces the ring down on the beveled face of the disk. This slightly expands the ring. The ring being thus expanded over a cone, is always carried upward and held in working position by its own elasticity.

The two beveled faces, therefore, give to the ring a self-supporting, self-adjusting and self-maintaining feature which entirely dispenses with supporting springs, adjusting screws and all other expensive and troublesome parts. This is of great importance for the utility and

practicability of a balance for slide valves. It is impossible for the ring to stick because of the beveled faces.

There are but two steam joints, one on the beveled face and one on the smooth top surface of the ring. These two joints are kept in perfect condition by the actual operation of the valve and the steam pressure of the chest; this insures long service of the valves without trouble or cost. The balance being circular, permits of any desired area being taken off the valve, two balances being used in place of one,

if necessary. The valve is therefore relieved of all the excessive pressure, leaving only pressure enough to hold it on its seat.

The balance is bolted to the valve by two or four bolts tapped into the valve; it can, therefore, at a trifling cost, be easily applied to old valves now in use—a very important feature to those already having engines.

Small holes are drilled through the bolts to relieve the interior of the disk to the exhaust. This method of relief does away with the necessity of a steam

SECTION OF SLIDE VALVE.

It is also in use on North Pacific Coast, South Pacific Coast, S. F. and North Pacific, the Virginia and Truckee, Carson and Colorado, the Union Pacific, and some of the large Eastern roads; for steamboat use, the California Transportation Co., Sacramento Transportation Co., Merchants' Tugboat Co., and Piper, Adin &

SECTIONAL VIEW OF PELTON WATER WHEEL HOIST.

joint between the bottom of the disk and the top of the valve, as would be required if a relief hole was drilled through them both. No relief valves are necessary in the steam-chest with this balance.

All balances manufactured by the American Balance Slide-Valve Co. contain tough, close-grained iron, and are made to standard gauges. The absence of springs, screws, etc., makes the valve positive in its action; the beveled ring obviates the necessity of any packing. The simplicity of construction, the true principle of self maintenance, the inability to injure it, and the easy adaptation to old as well as new valves, are features which recommend this balance, so that, while on the market here for less than a year, it has been very largely adopted.

For locomotive use it has been adopted by the Southern Pacific Co. as a standard valve.

Co. have adopted it. The valve is also used on several steam schooners, and a number of stationary engines in this city and elsewhere on the coast. The balance is made by the American Balance Slide Valve Co., 216 Mission St., San Francisco.

The Pelton Water Wheel Hoist.

The accompanying cuts represent a hoist designed by the Pelton Water Wheel Co. for use in connection with their wheels. The power from the wheel shaft may be transmitted by means of manilla rope or belting. The former, however, is preferable in most cases.

These hoists, as will be observed, are provided with powerful post breaks, affording absolute security in lowering and the friction made to engage by an eccentric box operated by a lever located at any convenient point for the engineer. Where the head admits, the water wheel can be operated direct to the pinion shaft, where the sheave is shown, and thus avoid all intermediate gearing. These hoists are built of any capacity desired and to suit all conditions of service.

The friction may be made either of paper or with V grooves, as shown. For heavy work and operating to a great depth, a geared hoist is used with reversible wheels, designs for which will be hereafter illustrated.

PLAN OF WATER WHEEL HOIST.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Ede.

Mexican Mining Customs.

A Sketch in the District of Guanajuato.

[Written for the Press.]

The mining district of Guanajuato, which is situated less than a day's journey by rail from the city of Mexico, having produced hundreds of millions of dollars since 1522, the greater portion of which was extracted from the ores of the "Veta Madre," has justly earned the reputation of having been one of the greatest lullion producers the world has ever known, having been worked for so many centuries and still producing annually bullion amounting to something in the neighborhood of \$3,500,000 in value, it follows that very rich ore must have been taken out, for the mines have never been worked in that energetic manner so characteristic of mining operations in the United States.

"Peon" labor being so cheap, it becomes a matter of economy to employ it in removing all possible waste from the material hoisted to the surface for subsequent metallurgical treatment.

Enclosure.

A space of several acres around the working shafts and tunnels belonging to mines of greatest magnitude is, as a rule, enclosed by a substantial stone or adobe wall, forming the "planilla," or ore floor, where sorting is carried on.

The space is enclosed to enable a systematic search of all employees leaving the works. A guard is stationed day and night at the doors of the enclosure, challenging all passing through them.

Inside, owing to the actual amount of manual labor being done in separating the ore into piles of varying richness, the scene is a busy one.

Sorting Ores.

There are men, women and children moving about in a rapid way, carrying baskets of ore, sorted and to be sorted, and from different piles on the "planilla" respectively.

There are others squatted in front of small water tanks, each with a little pile of ore to be sorted, engaged in separating into baskets the good from the waste.

Sorting is facilitated by moistening the material, which brings the valuable mineral into greater relief.

The waste which is thrown upon one side is not allowed to remain undisturbed, for the enterprising "Gamboleros," in most cases, enter into a contract with the owners of the mine to remove it from the "planilla" for the privilege of sorting out anything further it may contain.

About the Shaft.

The busiest scene is just about the mouth of the perpendicular shaft. Hoisting is being done, and rapidly, too, for Mexico by a horse-whim or "malacate." Six animals at a lively trot turn the drum around which the cable is being wound; but instead of seeing an iron bucket ascend from the mouth of the shaft, it is a surprise to see a rawhide receptacle, looking very much like an inverted parachute, and carrying a load that would weigh somewhere in the neighborhood of 500 pounds. The whole arrangement is detached from the shaft after being dumped into a car. It is difficult to imagine anything more pliable yet tougher than a water-soaked disk of rawhide. The material hoisted is distributed to different parts of the planilla, according to its nature.

The Water Bucket.

The greatest surprise of all is the water bucket made from two rawhides sewn together. It shapes itself when filled very much like an inverted balloon. It is a revelation to see one of these rawhide tanks hoisted in its immensity when full, but collapsing into a shapeless mass when it is landed upon troling.

One cannot help smiling upon seeing these primitive methods, yet a great deal of work is accomplished, the horse-whim in question hoisting over 70 tons of ore in a day of 12 hours duration from a depth, on an average, greater than 200 feet.

Primitiveness.

It is most singular but perhaps quite true that shovels and picks are scarce articles in mines about Guanajuato, the natives using canoe-shaped horn spoons for shovels and a gad or a bar for a pick. In filling the basket or bag the horn is used to drag the material into either receptacle; and to see an arriero (mule-driver) filling leather packing sacks enlignens one as to dexterity with even so simple an implement as this. Everything being conducted in such a peculiar manner upon the surface, it is natural to suppose that surprises will be in store underground.

"Boca Mina" and "Tenateros."

All those employed underground descend to their respective working places through the "Boca Mina," as it is called—an inclined way provided with series of steps reaching from the surface to the various stations and bottom of the mine. The steps of the series are not all of uniform inclination.

The ore carriers or tenateros (so called on account of carrying tenates or ore bags in which the whole product of the mine is handled), rush down these steps in a manner that seems quite

reckless to those unaccustomed to such a sight. The tenateros are paid by the number of "arrobos" (an arroba being 25 pounds) they move from the working places to the different stations, where clerks check names, number of loads and their approximate weights.

The "tenate" is carried on their backs and kept from falling by means of a hand attached to the underside, passing up the sides of tenate and around the head of the bearer.

It is a weird sight seeing these men of harden almost bent double under a load of from four to six arrobas passing in single file before the clerks, who are waiting at the dimly lit station to tally these wretches passing through their hands like so many animals, tallied and searched before the day is done and all for a pittance of a possible 50 cents in Mexican silver which they receive daily.

Devotions.

In many of the mines there is a little chapel or shrine at which the different operatives make their devotions, should they care to, both in descending the mine and ascending to the surface. There is an amount of reverence among miners of every nationality, and Mexicans show it in a great degree.

In ascending a perpendicular shaft they are suspended to the cable by means of a sling in which they sit, and while being hoisted they are chanting in order that they may reach the surface in safety. Being suspended to a cable in a sling, no guides, and three other cables in the shaft moving and stationary is quite sufficient to deter most men from making their exit through the shaft more than once.

Pumping.

Another surprise is the method of pumping one sees adopted in some of the Mexican mines. In those where a vast quantity of water is not made in a day, there are pipe lengths furnished with a long wooden rod to which is attached a suction valve at one end and a handle for the homero (pumpman) to manipulate at the other.

The water is removed by means of these primitive hand pumps to cisterns stationed at different depths through the workings, and from them to the "sump," where the balloon-shaped hide bucket is brought to play in its final removal to the surface. The pumpmen receive 50 cents a day, a stipend hardly sufficient to allow of many luxuries.

The Miner.

By means of hammer and drills, gad and bar, the Mexican miner is capable of breaking a quantity of ground but naturally he is handicapped in not being the possessor of a pick. Why it is that this article is so rare is a mystery that could only be explained by the Spaniards. Why they did not introduce it into Mexico is something to marvel at.

The miner is the best paid among Mexican mining employees, for drilling is paid for at so much a foot or fraction of a metre and it is quite possible for him to earn from 75 cents to \$1.50 per day, according to the number of "cuartas" he has accomplished. They are naturally envied by the less fortunate "homeros" and men on the "planilla."

Removal by Pack-Train.

Every morning the mines are visited by a host of arrieros (mule-drivers) with the mule-train. The ore sacks, made from leather or fiber, are in readiness for the mule-drivers at the mouth of the shaft. The work is given and in a remarkably small space of time the contents of the piles have been dragged into the sacks by the horn spoons; the sacks are closed, weighed, tallied and packed on the backs of mules (as fine animals probably as may be found in the Republic), and started for the reduction works.

Sale of Ore.

It has been the custom for years on the part of mine-owners to dispose of the daily output of ore to the "Hacienda de Beneficio" (reduction works), where it is treated by the Patio system of amalgamation.

The ore is purchased by the "Monton," or 32 quintals a trifle over a ton and a half and is removed from the mouth of the shaft by the purchaser. Competition being run between the reduction works at present, better prices prevail than formerly. The Maquila (charges against the ore) varying according to richness and the distance of the mine from reduction works.

Searching.

It was mentioned earlier that the employees were searched upon leaving the mine. Were this formality not gone through, it is reasonable to suppose that very little of the very rich ore would find its way into the hands of the mine-owners, but instead, the small ore purchasers would reap the benefit of hundreds of thousands of dollars annually. In many cases this very rich ore for export would represent the profits the mine was working. This searching, the peon has been accustomed to for such a length of time, that it is accepted as inevitable.

All are drawn up in line; two boxes about 12 feet apart are placed upon the ground in a line with the doors. Behind the second box are all the men, except he who is standing on the first box in the act of being searched. The searcher passes his hands down the back and chest (the man's clothing as a rule being nothing but shirt and trousers), follows both legs, looks into the shawl or "serape," and examines the hat which is held in the hand. The man is finally compelled to say "Al lado de Dios" meaning I am with God, in order to see whether there is any mineral hidden in his mouth. A

few moments suffices to go through this form with each man, he steps down and passes through the door, his own master until the following day.

It has not been the intention to criticize Mexican methods but simply to jot down that which may prove of interest as being novel and different to anything seen by the majority of miners in the United States.

Finding of the Lost Ship Mine.

Many are the legends which have been spun by the camp-fire and in the public press about the "Lost Ship mine," as well as about the final taking off of John Shippe at Visalia, some 23 years ago, while resisting arrest for disturbing the peace. Many an expedition has been organized to search for the mine. It was always assumed that Shippe's trail, after following up King's river past the U. S. Grant tree, turned and crossed the river at some unknown point. It never seemed to occur to the mine-hunters that Shippe probably followed the Inyo trail through the Kearsarge pass and east of the Sierras.

While calling on our patrons near Kernville, a few days since, we met David and Luther Burton, who informed us that they were just in from a five weeks' cruise on the desert to test the John Shippe mine. We elicited this statement: The mine was shown to Shippe by his squaw, who always accompanied him when he visited it. After Shippe's death, she returned to this vicinity and entered into an informal marriage with a certain prominent stockman of the South Fork valley, and one child was the result of the union. She showed her husband the mine, but as he had no taste for mining, he kept the location a secret for 17 years. Finding himself too much engrossed with the care of stock to handle the mine, he proposed to share it with the above named young man, but finally concluded to turn it all over to them. They then proceeded to locate the spring designated by the squaw as the place where Shippe ground his rock, and having found it, commenced to excavate to find an arrastra used by Shippe. At a depth of a foot and a half, they struck tallings discharged from the old mill.

We were given a piece of rock, and it is well honeycombed and well impregnated with oxide of iron. Among the oxides, bright specks of yellow gold are profusely scattered. The vein is partially gold-bearing, although it contains some silver. The ledge is about eight feet wide, and in some parts the gold occupies nearly the whole width, while in other places it only occupies a foot and a half.—*Farm View.*

CENTRAL GRAVEL MINE.—The tunnel of the Central gravel mine, on the Washington ridge, is nearly completed. It is now in over 650 feet, and Superintendent Chadsey thinks he has only 90 feet farther to run to strike the channel. Water is coming in freely at the top of the tunnel, and there is every indication of the close proximity of gravel. The tunnel is to tap the old shaft that was sunk 30 odd years ago. This shaft was put down to the gravel, where work was suspended on account of the water. Mr. Chadsey will run his tunnel to strike the gravel channel about 30 feet north of this shaft, thus draining the shaft through the gravel. This will be much safer than tapping the shaft direct. When the Central Co. of Sacramento took hold of this mine, they simply took a 35-year-old shaft, filled with water, and a lot of rather hazy information concerning the same. But the gravel was known to pay, and so they began operations and have stuck to it for several years. It is now thought their tunnel will not be low enough to drain the bottom of the shaft. But they will not let that bother them. If they come within 30 or 50 feet of the bottom, a pumping plant will be put in, and drifting commenced immediately. If the gravel is rich enough to warrant it, a new tunnel will then be driven lower down. They are bound to succeed, for they have "stayed with it" so long they will never give up now.—*Nevada Herald.*

A COMING MINING SECTION.—It has been known for 25 years that there were leads of gold, silver and copper on the reservation in the immediate neighborhood of Pocatello, Nevada, but prospectors have steered clear of the hills, as they had Uncle Sam and a jealous tribe of Indians to contend with. Now, however, prospecting is going on in many parts of the reservation, many claims have been located, a survey of the reservation has been ordered, and it will doubtless soon be thrown open to the whites.—*Silver State.*

THE RENO GAZETTE quotes John W. Mackay as saying that there is low-grade ore enough in the Con. Virginia to keep 200 stamp-running for 20 years. What an immense thing this will be for the Comstock if the ingenuity and scientific appliances of the Janins prove true of extracting the 25 per cent of the ores hitherto lost? There is much hope expressed in mining circles that they will accomplish all they claim they will do.

VERDICT AGAINST A MINING COMPANY.—The case of P. J. Keys against the Keys Mining Co. pending in the United States Circuit Court at Carson, Nev., during the last few days for the recovery of back salary as superintendent, amounting to over \$2600, went to the jury, who returned with a verdict of \$1015 for the plaintiff. Notice of a new trial was given.

The Mining Congress.

An Abstract of the Proceedings.

Associated Press dispatches dated Nov. 19th from Denver are as follows:

The session of the Mining Congress was delayed in meeting this morning through the tardiness of delegates in consequence of attending the drilling contest last evening.

Butte, Mont., broke all records in the way of double-handed drilling, and defeated the champions of Colorado.

The Committee on Credentials reported 559 delegates present from 31 States and Territories.

Niles Searles, ex-Chief Justice of California, was recommended for permanent chairman, and it was decided to discuss a number of subjects, among which was that of the coinage of silver. The report was adopted.

Judge Searles, in the course of his address accepting the chairmanship, emphatically indorsed the unlimited coinage of silver.

In the afternoon the Congress appointed one vice-president from each State. Chief Skiff of the Mining Bureau of the World's Fair was given 30 minutes to set forth the advantages of the Columbian Exposition and the necessity of the mining States making an exhibit that would give the world an idea of the importance of the industry.

Senator Wolcott, in a brief speech, set at rest all doubts as to his position on the silver question. He hoped that the congress would shape into proper form such matters as require legislation, and in closing his remarks said: "No matter what may be the wishes of the majority of the party to which I belong, or its oblique executive, and no matter how much my course may remove me from the sunlight of official patronage, until some new light crosses my vision, which is not yet dimmed, I will, as long as I remain in public life, vote for the free and unlimited coinage of silver." The audience arose and applauded Senator Wolcott until President Searles rapped for order.

E. R. Holden, as leader of the faction demanding the coinage of the American product only, predicted disaster and ruin to the banking and commercial systems of the country if foreign nations were allowed to unload their silver upon the United States and receive gold in return. He asserted that Mexico in another year would produce more silver than this country, and that one small district in Australia was preparing to produce more silver than Colorado.

Charles S. Thomas of Colorado replied to these arguments and hotly advocated the free and unlimited coinage of silver. The congress then adjourned until next day.

On the Committee on Resolutions the Chairman appointed as members at large Colonel C. C. Goodwin of Utah, ex-Senator H. W. Tabor of Colorado, ex-Governor Hauser of Montana, Robert Mackay of Canada, and J. J. Mullaly of Missouri.

Further dispatches, dated the 20th, say: The Committee on Resolutions appointed by the Mining Congress has agreed upon their report. It declares that certificates of the Government, backed dollar for dollar by gold or silver coin, on deposit in the Treasury of the United States, is a safe and sound currency, and has been approved by the people; that the First National Mining Congress is unalterably in favor of the principle of bimetallicism; that gold and silver should have by law equal rights, uses and monetary purposes, and to that end is demanded of the Congress of the United States the enactment of laws by which silver shall be coined free in all mints equally with gold, and to have with it full and unrestricted monetary power, and that they in the ratio of 16 to 1, and when the coinage is represented by Treasury notes, each dollar shall represent 412½ grains of standard silver or 25.3 grains of gold. One resolution reads:

WHEREAS, The Supreme Court of the United States has declared "that the exception of mineral lands from grants in Acts of Congress should be considered to apply only to such lands as were at the time of the grant known to be so valuable for their minerals as to justify expenditures for their extraction; and

Whereas, This dictum of the Supreme Court, if it should become a law, would invest the Pacific railway companies holding grants of land from the Government with a vast number of the best mines discovered within the limits of said grants by prospectors and miners, who have located thereon in good faith and developed and sold therein in the honest belief that said grants were limited to agricultural lands only, as declared in the Acts of Congress making them.

Resolved, That this Congress protests against any construction of the statutes of the United States which will result in such a system of wholesale confiscation and consequent enrichment of great combinations already enjoying the bounty of the Government and calls upon the Representatives of the people in Congress assembled to take such prompt and immediate action as may be in their constitutional prerogative to destroy the threatened danger.

Resolved, That the Alien Act, so far as it operates to exclude foreign capital from investment in the mining lands in the Territories, is false in principle and pernicious in effect, and this Congress demands its immediate repeal.

R. C. Powers of Arizona, an avowed advocate of free coinage, occupied an hour in discussing the use of silver from the earliest days of the world's history to the present time.

E. R. Brown of Aspen said that America should declare the parity of the metals.

At this juncture Senator Stewart arose and announced that he did not own a share of

Comstock stood, thus refuting an old allegation.

Judge Harley Morse of Colorado spoke for 20 minutes in favor of free coinage.

Martin Maginnis of Montana denounced Campbell in a scathing manner for his cowardice in not advocating the platform upon which he was nominated.

Congressman G. A. Cassidy of Nevada declared that every man, woman and child in Nevada was united in favor of free and unlimited coinage. Cassidy advocated the forcing of the political parties to make that question a dominant issue in the next campaign.

In the afternoon T. C. Howell of California made a speech, placing his State on record as in favor of free and unlimited coinage of silver.

General Doniphan of Missouri and Daniel Sheedy of Colorado also spoke eloquently in favor of free coinage.

Judge Goodwin of Utah made an address, in the course of which he said he did not believe that the lower House of Congress would pass a free coinage bill this winter unless with the hope of the President vetoing it. He thought that they would come to their senses, however, in time. He then moved that the resolution for the free coinage of silver be passed by acclamation.

Albert Little of Maine made a brief speech, saying that he had become convinced from what he had heard in this congress that the free and unlimited coinage of silver was right.

The Connecticut delegates objected to the passage of the resolution by acclamation, and the roll of States was called, with the following result: For the free and unlimited coinage of silver, 481; against, 8. When Connecticut was reached great enthusiasm was manifested by the delegation from that State announcing their vote in favor of the resolution, and when the vote of Canada and Russia was announced in favor of the resolution there was another scene of confusion. When the total vote was declared the delegates went wild, and it was some time before order was restored.

The other resolutions given above were also passed. A resolution was unanimously adopted congratulating the management of the World's Columbian Exposition for the work already done and urging every State and Territory represented in the convention to prepare for and make exhibits commensurate with the importance of the exposition and of the developed and undeveloped mining resources of the State. It was decided that the next convention should be held in Helena, and the congress adjourned.

A Prospector's Fate.

A dispatch from San Diego, dated the 19th inst., says: Two prospectors named Brown and Crawford are in Ensenada, after a long trip through the Cocopah country on the peninsula. By steamer, this morning came the particulars of the finding of another desert victim by them several weeks ago.

They saw that while prospecting southward from the Old Sulphur mine, about midway between the Cocopah range and the Colorado river, one day they suddenly came upon the body of a man, who had evidently died from thirst. The corpse was evidently that of a German. He had been dead many days, but the body was not decomposed, the dry air of the desert having preserved it to a remarkable degree.

There were evidences of the man having endured terrible agony. His finger nails had been torn off in his efforts to reach water by digging in the sand. The body was buried by the two prospectors, who then continued on their journey.

Two miles farther on they found the bodies of two horses, and the packs which the animals had carried in life were still attached to the bones. The outfit probably belonged to the German. The packs yet contained the bacon, flour and hardtack found in every prospector's outfit. There was nothing by which to identify the remains of the unfortunate.

Columbia River Scenery.

We turn again to the great Northern treasury of sublime scenery, the Columbia river, and give on this page a striking picture of the Oneonta gorge, one of the most interesting rock rifts of its most interesting region. The Oneonta name is given to a gorge, to a waterfall, and to a healing bluff, which overhangs the railway. All of them win the admiration of the resident and tourist.

WATER RIGHTS.—There is a great lawsuit pending in Lassen county, involving about 18 plaintiffs and 120 defendants, over water rights on the Susan river. The plaintiffs, most of whom are old and wealthy settlers, located on the lower end of the river many years ago, and have been using the water for irrigation all these years. In the march of civilization hundreds of people have settled along the upper part of the river, and very naturally diverted some of the water. Thus the amount flowing to the lands of plaintiffs grew less year by year. There is money on both sides, and no doubt the case will not end until settled by the Supreme Court.

FENCING IN THE RAILROAD.—The Northern Pacific is fencing its road at the rate of 3000 miles a year. In the year ending June 30, 1891, there were killed on its lines 4258 head of cattle, against 4802 in the previous year.

Dredging Bars.

An Extensive Mining Undertaking Outlined.

The San Joaquin river is said to be as low now as it has been for three or four years, says the Fresno *Expositor*, and the low stage of the water naturally calls to mind again the beds of gold-bearing sands and gravel that miners have always believed were in the bottom of the river all the way from Millerton to Hamptonville, and farther down for an indefinite distance.

It is known to an absolute certainty that the bed of the river in that vicinity contains much gold, but just how much cannot be known. There are those who believe that there is enough of the precious metal lying beneath the water and mixed with the sand and gravel that the floods have brought down, to make many men independently rich, if it all could be taken out. This has been a prevailing opinion among miners since the days when the sand bars and

the channel and pan it out. Scoops and spades and baskets and other similar arrangements have been employed, with results that go to show conclusively that there is much gold in the bottom of the river; but the means of getting it out are so rude, and the expense so great, that the undertaking never was very profitable.

When the river is low, as it is at present, considerable success has attended these efforts, but it all has been on a small scale, without much system, and each man working for himself and against everybody else.

A Large Plan.

Last summer a series of estimates were made, but were kept very quiet at the time. The purpose was to test the practicability of putting in an extensive dredging apparatus in the river along the Hamptonville toward Millerton. This was not the scheme of tunneling the mountain, thus leaving the channel dry, and laying bare all the beds of sands which thou-

also be lifted by the pump, along with sand, and all would come up together.

Sluice-Box.

The large barge, bearing the pump, the engine and the dredging machinery, would be firmly and securely anchored in its place. Below it, that is, down the river, would be smaller boats, also securely anchored, and these small boats would serve as piers on which to rest a long line of sluice-hoxes, through which the sand and gravel could be carried off, and dumped a considerable distance down the river, out of the way.

These sluice-hoxes were to be the kind ordinarily used in placer diggings, with the arrangements in them for collecting and holding the gold that should be separated from the gravel.

The larger howlers, too heavy to be carried off through the sluice hoxes, could be dumped in a boat kept for that purpose, and taken down the stream a short distance till they were out of the way, and there could be unloaded without much trouble or expense.

By this means the pump would lift all the sand and gravel within reach of it; this gravel could be sent through the sluices, the gold could be separated from it and retained, while the waste would be carried out of the way.

Moving the Barge.

When no more debris was in reach, the barge could be moved farther up the river and new beds brought within reach of the pumps. The time, trouble and expense of moving the machinery need be very small, in fact, this item of cost is said to be so small that it need not be taken into consideration at all. The whole time for a move would be only a few minutes.

Up the Stream.

Thus the dredging pump would work its way slowly up the stream, pumping up the gravel and sand, and leaving the bedrock bare as it went, and removing all the refuse down the stream, entirely out of the way.

There would be nothing left undone. The paying gravel would all be pumped up and removed. As the machinery would move up the river, nothing for the miners of the future years would remain. The rocks too large to be lifted by the pump (and there would be many of them) would not need to be removed, as they could be left lying in the bottom of the river. The pump is so constructed that it will dig down among the large rocks and bring out all the sand and small gravel.

The Estimate.

The gentleman who was here making estimates in the matter stated that in his opinion there would be as much as one pump, even of the largest size, could handle in several years. The gravel is very deep in many parts of the channel, and it would take some time to reach the bedrock.

The quantities of gold that would be obtained cannot be so accurately estimated; but there is no person who is acquainted with that locality, and with the history of the mining that has been done there in the past, but that is satisfied that the pay will be very large, and will fully remunerate for the outlay, notwithstanding the expenses of putting in the machinery and running it may be considerable.

At any rate, it is considered that the scheme of pumping up the gravel and running it off through sluice boxes is much more practicable than the one of tunneling the mountain and thereby turning the river from its channel. At any rate the pumping plan is less expensive, and if it will pay at all, it will pay more or less from the start.

In the tunnel proposition this is not the case. The expense will be very large before any return at all is made. It cannot be stated whether there is anything going to be done in the matter, but elaborate plans and estimates were made looking to this end some time ago.

ONEONTA GORGE ON THE COLUMBIA RIVER.

gravel beds on the margin of that stream first began to give up their golden spoils.

Early Diggings.

The early diggings in that vicinity yielded fairly well. There were many rich patches found along the river beneath the gravel. The farther toward the middle of the river the miners could go, the richer the soil.

But the water was in the way of approaching the mid-stream, and the deepest part of the channel, where it was natural to expect the most gold. When the river was low, it was impossible to work a little way toward the channel, but never very far; but, as has been said, the farther the miner could push his placer diggings toward the middle of the stream, the richer were the findings.

For many years the miners worked all along the river, both above and below Millerton, and even yet there is some mining done at times; but the best paying patches were long ago exhausted, and the miner had to content himself with a small find here and there.

But the fact that the large and deep beds of gravel in the main streams were untouched was never lost sight of, and all the time the old miners, who had seen the prosperous days back in the fifties, cast longing eyes toward the stream that flowed over such beds of golden sands, just beyond their reach—"so near and yet so far."

Diving for Gold.

More than once efforts have been made to fish up the sand and gravel from the bottom of

sands of years of floods had brought down. The tunnel project was another and independent scheme.

The *Expositor* was in possession of the facts regarding the plan for dredging the river, but for special reasons did not make the facts public at that time.

Now, the plan can be published; but at the same time it cannot state whether anything will be done with the plan or not. A mere statement of what the plan was is all that will be given at this time; and there are none who would deny that it is practicable, and would develop the gold-beds beneath the waters of the San Joaquin nearly as effectively as the tunnel through the mountain and the changing the channel of the river would do, and very much cheaper.

Dredge Pump.

The plan as proposed was to build a large barge, on which could be placed an engine and a dredge pump, such as are used in dredging harbors and deepening the channel of rivers.

A pump of this class, capable of lifting gravel and boulders from the size of the smallest sand up to a size of four or five inches in diameter, was what it was proposed to use. Such a pump would lift ten tons an hour.

The plan was to begin at the lower end of the bar, and pump up the gravel and sand clean, leaving nothing but the naked bedrock on the bottom of the river. Of course the gold mixed with the sand and gravel would

GOLD EXTRACTING WORKS.—The Kron Rolls, which have been set up at the Gold Extracting Works, were put in motion to try the machinery and see that it was in perfect working condition. The trial was entirely satisfactory, and the rolls will now be put to work in reducing ore into fines. The ore will first be put through a rock-breaker and then fed into the rolls, being crushed dry. When reduced to the proper fineness, the ore passes through a screen (with 40 meshes to the inch) and then deposited in a bin, the whole being inclosed to prevent the fine particles filling the atmosphere. As the rolls are graduated, if the ore is not reduced to the proper fineness at the first crushing in passing through the screen, an elevator raises it up for additional crushing. The steel tires on the rolls are hardened by a process only known to the manufacturer, and their wear by attrition with the rock is slow. When necessary, these tires can be replaced by new ones, as in the case of shoes and dies in stamping batteries. It is claimed for the Kron rolls, of the size of those at the extracting works, that their crushing power in 24 hours is equal to a 30-stamp mill, should the work to be done require it. This machinery is driven by a Pelton wheel, with 20 inches of water under 500 foot-pressure.—*Grass Valley Union*.

A VALUABLE MINE SOLD.—The valuable property of the Lilloet Hydraulic Mining Co., situated near Lilloet, B. C., on the Fraser river, has been sold to New York capitalists for about \$300,000. The papers are to be at once forwarded to New York through the bank of Montreal.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador *Dispatch*, Nov. 21: The mines are getting along about as usual. At the Wildman the mill has been shut down for a few weeks, so as to give the men in the shaft a better chance to work. They have only one compartment to hoist in and in sinking, the bucket is required to handle timbers, waste, etc. The Hector mill started up 30 stamps on Monday. The other 10 stamps will be ready by the first of next week. Retimbering the shaft is progressing slowly, as only a day shift is working. The new hoisting works give very good satisfaction. The Lincoln Co. are getting ready for winter. They have just completed the cleaning of the ditch and had some repairs on the mills. The Belmont mill is idle at present. The South Eureka is still sinking with favorable prospects. At the foundries business is quite slack at present. Knight & Co. are doing some electrical work.

SOUTH SPRING HILLS.—*Ledger*, Nov. 21: For some months this mill has not been turning out bullion after its accustomed liberality. It has been passing through a period of depression to which all the prominent mines on the mother lode have been more or less subject. It is an erroneous impression that seems to prevail upon the minds of many outsiders that the gold is evenly distributed through a gold-bearing quartz vein; and that when a mine once begins to pay dividends, the dividend-paying era should continue just so long as the mill is supplied with ore to crush. This is not so. The ore-body has its mutations in gold-bearing qualities, as well as in dimensions. It widens out and narrows up, gives up its treasures liberally or niggardly, as the case may be. The South Spring Hill is just emerging from a comparatively barren portion of the vein. The product lately has only just about kept pace with the expenses. Now, however, there are strong indications that another prosperous era is about to dawn. At the 900-foot level the vein begins to show its old time character, and the stockholders are correspondingly elated. Some 30 men were laid off at the Clinton Consolidated this week on account of the failure of the water supply. It is believed that it is only temporary. It is reported that the Amador Queen mine in Hunt's gulch is about to be started. The property was lately deeded by the Amador Queen Co. to W. B. Bardue, and work is to be inaugurated under his management. Timbers and other supplies are being hauled to the mine.

El Dorado.

BLUE GOUGE.—*Mt. Democrat*, Nov. 21: Wm. Craddock has been up to the Blue Gouge mine for several days, returning Tuesday. Mr. Craddock is very favorably impressed with that property. It is a large vein of low-grade material, worth from \$3 to \$6 per ton, and enough of it practically in sight to supply 100 stamps for more years than most of us shall live. They can run a tunnel in from the creek to tap the vein over 500 feet below the surface, from which level, ore can be taken for a lifetime without hoisting, and with their own water-power. Mining and milling can be so cheaply done that ore which will yield even \$1 per ton can be worked at a good profit.

Inyo.

DARWIN MINES.—*Inyo Index*, Nov. 18: These mines, always good, but of late years rather quiet—are awakening and coming to the front. Jack Wilson was in town last week and gives encouraging reports from that, the New Coso district. The Independence mine, the excellent prospects of which have before been mentioned in these columns, is proving all its owners have predicted, and now shows the largest body of ore ever seen in Darwin. They have a large lot on the dump, much of it sacked, but find difficulty in shipping as rapidly as they wish on account of the scarcity of teams. The Sorba mine, a recently developed prospect, is looking way up, and that being worked by Lewis & Co. is also looking very well. In the Defiance all is encouraging. Frank Fitzgerald and J. J. Gunn are both getting out lots of rich ore and making regular shipments from Modoc. More men are needed in and about Darwin to get out the ore, and more teams to haul it away.

Mono.

THE BODIE CON.—*Bodie Miner*, Nov. 21: During the past week east crosscut No. 1, 700-foot level, was extended 12 feet. East crosscut No. 2 from main north drift, 700-foot level, was extended 6 feet. Upraise, 620-foot level, was extended 21 feet. South drift, 6n feet above the 5nn-foot level, was extended 7 feet. North drift from top of upraise from west crosscut, 200-foot level, was extended 8 feet. East crosscut from top of upraise from main north drift, 200-foot level, was extended 10 feet. There were employed 8 miners and 1 carman, and jointly with Mono, 1 engineer, 1 blacksmith, 1 carman, 1 watchman, 1 foreman, 1 assayer and carpenter, 1 boiler-maker.

THE MONO.—During the past week south drift No. 2, 700-foot level, was extended 15 feet. East crosscut from south drift, 700-foot level, was extended 5 feet.

Nevada.

THE NORTH BANNER.—*Grass Valley Union*, Nov. 21: Important improvements are contemplated at the North Banner mine, the plans for which are now being drawn at San Francisco. The main incline, which has heretofore been used for the purpose of raising the ore and water to the adit level is to be raised to the surface, a distance of 300 feet, and a new steam and water plant erected, either power being used as required. From the new works a tramway will be constructed for conveying the ores to the mill, which will be about 800 feet in length. Larger pumps will be put in to control the water, which has been found to increase in volume since the new 500 station below the adit tunnel level has been opened, and where a strong vein, carrying high-grade ore, is shown. The adit level will be continued in use for the purpose of drainage. By extending the incline to the surface, the mine can be operated to better advantage, and by the use of larger pumps, interruptions cannot again occur, as has been the case for several months past. The work of opening the incline will require about three

months, as the ground is favorable and sinking and raising will be carried on at the same time. In the meanwhile the new surface plants will be put up. When the new works start up, sinking for the 600-level will be started. The appearance of the mine for making future large returns is in all respects very encouraging.

MERRIMAC MINE.—*Grass Valley Union*, Nov. 19: Supt. Chas. Stocks is pushing the work of reopening the Merrimac mine, having a force of 11 men at work in preparing the ground for the erection of hoisting and pumping works and repairing the old shaft. Both a water and steam plant will be put up, the steam to be used when an interruption of the water may occur, of which there is a probability at times in the winter season when snow storms may obstruct the flow of water in the South Yuba canal. The company starts up under good auspices, as 40,000 shares of the capital stock have been sold for a working fund, sufficient to erect the necessary buildings, repair shaft and drifts, and doing a large amount of dead work.

WASHINGTON TOWNSHIP.—*Cor. Nevada Transcript*, Nov. 23: Our mines that are working move along quietly, and their managers don't have much to say. Yet we have one of the best quartz mining districts in the State. There are a number of good gold-bearing ledges in this vicinity. All we need is capital to work them. In Lindsey Hill is the Lindsey mine which has proved itself to be good. The Blue Jay is a first-class prospect; so is the Day claim. The Governor Morton is one of the richest prospects ever found on the Yuba river. There are two other promising claims in the same locality, making in Lindsey Hill six good known prospects, all of which could be reached by a tunnel from the foot of the Hill. Next we come to the German mine, then to Fritz Meister's, both on Canyon creek. Donahue & Stewart also have a splendid outlook on Canyon creek, and so have the White Bros. The Valentine, owned by M. M. Cole, has a shaft down 100 feet and 500 or 600 feet of tunnels. This mine prospects well from top to bottom, and is good for \$20 a ton. The Giant ledge, a mile from Washington, is 20 feet thick and prospects \$9.60 a ton. There are around Washington more such locations owned by men too poor to develop them. There is a chance here for all the mining capital in San Francisco to be profitably employed.

Plumas.

GREEN MOUNTAIN MINE.—*Greenville Bulletin*, Nov. 18: The work on this property is progressing favorably. We are of the opinion that next season this mine will be seen operating on a large scale. Mr. Cornell has worked hard to put it in good shape, and he has accomplished a great deal. With the large tunnel pushed ahead and cross-cut work done, an immense mining property will be developed, for the cluster of mines lying ahead in the mountain will all become tributary to this tunnel. This mountain may be said to be a network of gold-bearing quartz veins, which, with an intelligent use of capital, will be made to yield up its rich deposits of treasure. In its proportions and possibilities this mining enterprise is gigantic. No extraordinary expense in either mining or milling the ore will be necessary. The hacks would be more than 1000 feet, and all of the ore, by means of the tunnel, would be dumped into the 60-stamp mill at the foot of the mountain, which is run by water power furnished by the Round Valley reservoir. The ditch leading from this body of water to the Green Mountain mine, is in better condition than it has been for a number of years, the result of Mr. Cornell's work last summer. In a few days, A. R. Bidwell, now of Oakland, will arrive here and take charge of the mine, in the absence of Mr. Cornell, and it is the intention of the owners to push development and other work as fast as possible.

San Diego.

AT JULIAN.—*Sentinel*, Nov. 18: Robert Gardner will resume work at his old stand on the Blue Hill. The owners of the Chaparral have again commenced work in this property and have milled a small crushing. The Helvetia is running a full force and ten stamps. The need of the hour at this property is more water. Messrs. Shide and Slocum have taken a lease on the Poorman mine. From the foot of a 60-foot shaft they intend running a level to cut the Joker ledge. Work on the Ruby, Ready Relief, Hidden Treasure, Cincinnati Belle, and Gold King is steadily progressing and every day adds to the value of these mines. Assessment work on the Richmond has developed that mine into a valuable property. A two-foot ledge of medium-grade ore is in sight, together with a narrower stringer of very rich rock.

Shasta.

THE SKY BLUE CAMP.—*Redding Free Press*, Nov. 21: E. P. Connor informs us that matters are lively on the east side of the river above Middle Creek station. The Crossbow mine is showing up good. Ore that assays up in the thousands is being taken out of the drift. The ledge is six feet wide. The ore is being shipped to S. F. for treatment. This mine was bonded some time ago to the Unity M. Co. A day and night shift are employed. Mr. Connor has five men taking out ore from the Castle Peak and the Manatee. The Manatee mine is the first extension of the Sky Blue on the south. The Manatee shows a three-foot ledge of excellent ore. The shaft is down about 40 feet and will connect with a tunnel 90 feet long. Marich, the Redding barber, has two men sinking on his ledge. They are down about 20 feet and have a three-foot ledge. It is a good prospect.

NOTES.—John Bauder has sold his interest in the Banghart mine, located at the head of Mad Mule in the Whiskeytown mining district, to his partner, John Fleming. The Texas Consolidated mine at Old Diggins has been bonded until Jan. 1, 1892, to a Chicago company. This is one of the best mines in Shasta county and the bond is for a big price. Mr. Parker and Mr. Bryan, interested in the Crown Point Consolidated mines lying between Middle Creek and Shasta, are here from Sacramento to look at the property preparatory to commencing operations. This company is a strong one, composed of S. F. capitalists. Col. Lyons, who was in Redding on Thursday, informs us that he has a five-foot vein in his tunnel at the old Martin mine in the Old Diggins district. The tunnel taps the vein 100 feet from the surface. Gold predominates, yet the sulphurets assay all the way from \$20 to \$200 per ton in silver.

HIDDEN TREASURE.—*Shasta Courier*, Nov. 21: A correspondent from the Hidden Treasure mine,

on the Iron mountain road, says: If you happen up this way, would be pleased to have you stop and look at our mine. We are not making much noise, but we can show one of the best prospects in Northern California. We have about \$1600 worth of improvements in the shape of cuts, shafts, tunnels, buildings, and also a small mill on the creek, known as the Day vacuum stamp mill, which runs by water power, capacity about 3000 pounds per day. Will have a Blake rock-breaker this week for crushing shipping-ore and for the mill. The ledge is about two feet wide and averages about \$7 per ton in free gold. The returns from the Selby Smelting & Lead Works, S. F., gave for one lot of sulphurets ore, silver, 10.84 ozs.; gold, \$38.76 per ton; onelot gave of sulphurets ore, silver, 76.65 per ton; gold, \$221.10. We have been going along slowly, but at present are pushing the mine for a paying proposition, with all the hands we can work to advantage inside and out of the mine. Will ship the high-grade ore, and run on the free gold ore.

IGO.—*Cor. Shasta Courier*, Nov. 21: The cross-cut at the Crystal has been discontinued, and sinking on the pay chute of ore will probably be resumed. The south drift shows a length of 60 feet of ore; it extends also to the surface 100 feet, showing a four-foot ledge, with six to 12 inches of at least 200-ounce ore. Wright & Sons' mine improves with depth. Two shipments have been made since my last. The second shipment went over \$200 per ton. The ore now assays up to 800 ounces. W. D. Bull's second shipment did not go quite as high as the first, but the ore has widened from a finger's thickness to five inches, and has all appearances of permanence. Robinson & Son have found a vein of good shipping ore in their yard, and are taking some fine ore therefrom. The Euhanks boys are getting excellent ore from their ledge. Woodfill also has good ore in his shaft. A rich find has been made in Kanaka on Sec. 10. How extensive it is has not been determined, the parties interested being at work on the other mines. O. Engle is doing some development work on his gold ledge in Kanaka. Shirland & Bro. are running their arrastra on Creighton ore; they are also opening a silver prospect close by. E. L. Ballou is running his arrastra on Manzanita ore. Litten & Moody are doing fairly well with their arrastra. The tunnels so far run show a larger body of ore than was expected. The numerous finds made the past few months have started even the chronic growlers to prospecting in the hills; and as the country hereabouts is full of small veins of varying richness, it is quite possible they all may "strike it rich."

Sierra.

FOREST CITY.—*Cor. Mt. Messenger*, Nov. 21: Times are improving somewhat hereabouts, due to the favorable developments in the Bald Mountain extension, and encouraging prospects in other mines. The cleanup for last week's work at the B. M. Ex. drift mine was 88 ounces. As soon as water is sufficiently abundant the number of drifters will be largely increased. Everything is favorable for a rich and permanent mining property.

Siskiyou.

CHINESE COMPANY.—*Yreka Journal*, Nov. 18: The Chinese company at Benz Bar, Klamath river, is now sinking another cut, from which the miners will no doubt realize as good if not better pay than from the last cut, which paid handsomely.

GRAVEL.—Phil Mott & Co., below the above claim, are now taking out good pay in cleaning up hedrock, and will realize considerable more dust before the river mining season closes. The old Sleeper claim, just below Honolulu, Klamath river, is paying exceedingly well, and the outcome will be an unusually large yield of gold dust this season. The Beebe Bar claim, above Honolulu, has been shut down, owing to reaching high hedrock. In reopening again next season, work will be resumed in a new direction to reach the bed of the ancient channel in the Klamath Basin at that point. Martin Andrews & Co. are still working their river claim below Hamburg Bar, on the Klamath, but how they are doing at present we are unable to learn, except that during one week lately they cleaned up 100 ounces. Maplesden & Co., in same vicinity, are also working industriously in their river claim and doing well. Work is carried on day and night at the Hegler Bros. and Aldrich quartz mine on Hamburg creek, in getting out an abundance of quartz from a 5-foot ledge, which keeps the mill supplied constantly. Boyle & Co., Spencer & Co., and others on Hamburg creek, are also taking out considerable quartz, which pays well.

QUARTZ.—The Portuguese Company, in the Humphack quartz mine on Salmon river, closed a trade with a Los Angeles Co. last week, by which the Los Angeles men are to pay \$120,000 cash within 10 days time. A new mill has just been completed at this claim, and is ready to start up when sufficient water comes, which will be very soon now. Over 400 tons of rock are on the dump, that will yield at least \$70 per ton, and a large force is kept constantly employed getting out more quartz.

Tuolumne.

RAWHIDE.—*Union Democrat*, Nov. 21: The Rawhide mine is producing ore in quantity of exceeding richness in free gold, and steadily improving as the work of development, under the able charge of Mr. Nevill, proceeds. It seems destined soon to be the leading mine of this section of the State. It is one of the old abandoned mines of California.

THE EXPERIMENTAL GULCH MINE, near Columbia, is in profitable operation. The grade of the ore is low, but the great extent of the ore bodies, inexhaustible in fact, the favorable location of the mine—no pumps nor hoisting works being required—the fine water power, and the economy with which the ores can be mined and milled make it a safe and profitable investment. The chief factors in this mine are its permanent character and ability to yield large quantities of ore.

PLACERS.—*Independent*, Nov. 21: Very rich placers are now being developed on Kincaid's Flat, Luis Page, now mining on Bald Mountain, once owned, with three brothers, the Bonanza claim. There are some placer claims near Confidence that were never exhausted, although they produced over \$25,000.

IDLE.—The Keltz mill has been idle for some time on account of the scarcity of water. Work is still carried on in the mine.

POCKET.—Darsey & Conn are working upon the same ledge upon which the Bonanza is located. They found a small-sized pocket a few weeks ago, and are looking for another. A number of men are

placer mining on Frown's Flat, in ground that has been worked over five or six times. They are sluicing in the old-time fashion, and yet claim to be making wages. The old Pedro vein on Bald Mountain is still being worked. It has been mined for several years, and a large amount of gold has been found—as much as \$20,000 in one pocket, and many others of less magnitude. A pocket was found a short time ago.

SOULSBY.—It is announced that the Soulsby mine, one of the most prominent mines in the county, has been purchased by a company. Lewis Page, 35 years ago took out \$100,000 from a chute on Bald Mountain. Like too many of our successful miners, he was careless with his money, and after mining in other States for several years, he returned to good old Tuolumne. He formed a company, and is running a tunnel into Bald Mountain to drain a ledge which he has every reason to believe is rich. They are working eight-hour shifts, two men on each shift. The tunnel is now in 460 feet, and it is 240 feet farther to the shaft. The work will cost about \$10,000 before any gold is taken out, but the company seems prepared to spend it, and confident of a rich remuneration.

OPHIR.—A rich body of ore has recently been struck in the Ophir mine, at Easton's, above Cherokee Flat. The mine is owned by P. H. Way, P. Easton and Mrs. Easton. The company has expended a large sum of money in the erection of a stamp mill, hoisting works, pumps and other paraphernalia, besides incurring the expense attending the sinking of an incline several hundred feet through dead rock, every foot of which had to be blasted. The owners were fully warranted in making such an outlay, as between \$16,000 and \$17,000 had been taken out from the same vein by a mere prospect in a shaft above, where ten tons still lie that will produce, the owners claim, \$300 per ton. The vein, from a feather edge, has within a few feet widened to several inches, and a milling test showed that the ore held gold to the extent of \$472 per ton. It is conceded by mining men to be very rich ore, and the indications are that the chute will widen. The ore in place is very handsome. The sulphurets carry galena, antimony and tellurium. The pump is worked by a burdy-gurdy. The company has a five-stamp mill and a Woodbury concentrator.

NEVADA.

Black Knob District.

ANTIMONY.—*Reno Journal*, Nov. 18: Extensive operations are being carried on in Black Knob mining district, 15 miles from Lovelocks, in Humboldt county. There are two well-defined antimony leads in the district. These are owned by Eastern men and are under the management of Dr. H. H. Hutchens, who is a practical chemist and assayer. There are ten claims of 1500 feet each on the lead. Two or three of these claims are developed by shafts and tunnels to a considerable extent. There is a shaft 300 feet on one of the claims, and drifts have been run on the lead from the shaft, 100 feet on the first level, 200 feet on the second and 300 on the lowest. The ore vein ranges in thickness from six inches to four feet. The ore averages 33½ per cent metal, some of it running as high as 75 per cent, which is pure antimony, wholly free from gangue, and melts readily in the flames of a candle. It is estimated that there are 4000 tons of ore in sight in the mines, and 400 tons on the dump. Dr. Hutchens has built a double reverberatory furnace of his own design at the mines. There are only one or two smelting works in the United States for the reduction of antimony ores, and these are built on different principles from that at Black Knob. As soon as the arrangements now being made are completed, the furnace will be run steadily, coal being used as fuel, and carloads of star antimony will be shipped weekly from Lovelocks to the East, where it is in demand for making type, habbit metal and for numerous other purposes.

Cherry Creek District.

THE STAR.—*White Pine News*, Nov. 14: News of a cheering nature reaches us from Cherry Creek. It is to the effect that the Hayward party of San Francisco has purchased the Nelson Con. M. & M. interests there, and that they will commence work immediately to pump the water out of the Star mine. This good news reaches us so direct, there is hardly a doubt of its authenticity. We hope in a few weeks to be able to congratulate the people of Cherry on having a live San Francisco company operating on Star Hill.

Pahranagat Lake District.

LOW-GRADE ORE.—*Cor. Piche Record*, Nov. 19: Mr. C. Rogers, a prominent citizen of Hailey, Idaho, who was reported in the *Record* two weeks ago as having gone to Pahranagat mining district, has just returned therefrom, and started back toward Hailey. The whole country he said goes far beyond my expectations, and it is a question in my opinion, of a short time only, when capital will be introduced to lend its helping hand to that section, so rich in its mineral resources. It is so seldom, continued he, in substance, with an expression that told of a varied experience, that one actually sees more than has been described in mining matters that is indeed worthy of comment. There are some tremendous bodies of ore in Pahranagat district ranging from 4 to 20 feet in width, that will assay from 40 ounces to 60 ounces in silver, and now and then interspersed with pockets that will assay away up into the hundreds. It is this rich ore that is alone finding a market. The greater portion of the ore is of too low a grade to seek the ore market which Salt Lake City now affords. The work of prospecting has gone on and is going on quite extensively. All the ore is raised to the surface, the richest sorted out, and the balance left. "How much, in your opinion, is there of this low-grade ore on the dump," asked the writer. "At least 4000 or 5000 tons on the dumps that will assay from 40 to as high as 60 ounces in silver without sorting. Some of the veins, or the croppings from them, can be traced for a distance of over five miles in length. There have been numerous locations and relocations made in the last three years. One man, named Geer, a prominent farmer of Pahranagat valley, is the owner of about 16 fine-looking claims, and he works continually from 7 to 25 men in keeping up his assessment work and developing his property. I saw the places where two mills formerly stood, and the place also where one smelter eked out a short existence. The smelter of course could not be made to run on the highly silicious ores of the camp. The mill, however, was said to have run with a little more

success. Wm. Raymond, formerly of the Raymond & Ely mine (that the P. C. M. & R. R. Co. now owns) run one mile there, until through the extra inducement offered by the subsequently named R. & E. mine, he moved his plant to Bullionville. The pan process was said to have been handled there with more success by a Mr. Bidwell, who worked transient ores raw for about 25 per cent of what was contained in them. He, like Raymond, deserted the place with his mill to operate in another part of the State where the assays are said to have run from \$400 to \$500 silver per ton. The principal part of the silver is in the form of sulphurets. The gangue is in white quartz, with specks of black iron and a little copper running through it. I ran across some perfectly barren looking white quartz there, which, to my utter astonishment, ran as high as 35 ounces per ton.

Tuscarora District.

NORTH COMMONWEALTH.—*Times Review*, Nov. 21: Second level—West drift from south drift advanced 25 feet. Winze from intermediate drift is down 26 feet, exposing high-grade ore entire distance; progress for the week, 16 feet. Hoisted 14 cars first-class ore, average assay \$356 per ton, and 56 cars second-class, \$30 per ton. Shipped to railroad 43 tons first-class ore.

DEL MONTE.—Third level: No. 1 raise advanced 21 feet; 18 inches of \$60 ore exposed. South drift from No. 1 raise extended 11 feet, showing 12 inches \$30 ore. No. 2 raise extended five feet; small seams of ore on top. North drift from No. 2 raise advanced 22 feet, with good ore still in face of drift. Seventy-eight cars of ore hoisted.

NEVADA QUEEN.—Second level: No. 1 south drift extended 15 feet; face is looking very favorable, showing some high-grade ore. No. 2 south drift advanced eight feet; seam of ore assaying \$256 per ton.

COMMONWEALTH.—South drift from No. 2 raise advanced 22 feet, following seam of ore 22 inches wide, assaying \$83 per ton.

NORTH BELLE ISLE.—No. 3 north drift, 400-foot level, has been advanced 12 feet; the vein is showing again some ore. No. 2 upraise has been advanced 13 feet and stopped, and stopping commenced. No. 1 winze sunk 12 feet and will again cut the vein in a day or so. North intermediate above 400-foot level advanced five feet, and a short crosscut west has encountered some good ore. Line crosscut on Belle Isle 400-foot level extended 17 feet and stopped for the present. Stopes at north end yielding as usual, and ore is being sacked for shipment to Carlin.

NAYAJO.—No. 2 upraise from south intermediate drift below 350-foot level has been extended up 12 feet. The stopes are producing the usual amount of good ore. Have commenced an upraise above 150-foot level on the west vein.

BELLE ISLE.—The north drift on 150-foot level has been advanced six feet; the rock is still very hard. Line crosscut on 350-foot level advanced 18 feet. Stopes are yielding as usual, and ore is being sacked preparatory to a shipment to sampler at Carlin.

Washoe District.

CON. CAL. AND VA. MINE.—*Virginia Chronicle*, Nov. 21: 1100 level—The west crosscut No. 1, started from the south drift at a point 100 feet south from the shaft station, has been extended 45 feet; total, 380 feet, in porphyry carrying clay separations and lines of quartz. Are stopping out nulling ore between the crosscuts Nos. 4 and 5 from the south drift. 1750 level—In working out and upward from the bottom of winze No. 2, sunk from the 1650 level, we continue to extract ore of fair quality. Have also extracted some milling ore at the point where the upraise carried up from the crosscut run west from the southwest drift made connection with the stopes on the eighth floor. Have continued to extract ore of average quality at the point where the upraise from the southwest drift 70 feet north from the south line of the California ground connected with the eighth-floor stopes. There has been extracted from all parts of the mine during the week 1000 to 2000 tons of ore, which was shipped to the Morgan mill. The average assay value of all of the ore worked at the mill during the week (980 tons) was \$22.83 per ton. Bullion shipped to Carson Mint, assay value about \$11,531.64.

OPHIR.—1465 level—Have continued our prospecting work near the point where the upraise from the sill floor of this level connected with the drift run west from the winze 122 feet below the sill floor of the 1300 level. No ore has been extracted during the week.

MEXICAN.—On the 1465 level the winze started at the end of the crosscut run west from the main north lateral drift at a point near the south boundary line of the mine, 132 feet in, has been sunk 16 feet; total depth, 30 feet, in porphyry carrying quartz of very low assay value.

UNION CON.—On the 900 level the joint Sierra Nevada and Union Con. west drift from the shaft has been extended during the week 34 feet; total distance west of the shaft, 1386 feet, the face being in clay and porphyry.

EXCHEQUER.—East crosscut from the north lateral drift, 150 feet south of north line, 600 level, is out 110 feet; face in porphyry.

WARD COMBINATION SHAFT.—The southwest drift, 1800 level, is out from shaft 166 feet; face in porphyry.

BULLION.—The east crosscut on the north line, 1300 level, is out 345 feet; face in clay and streaks of quartz.

CHOLLAR.—The south drift from incline station, 1500 level, is advanced a total length of 387 feet; face in porphyry. Are making usual amount of repairs on various levels. Extracted and sent to mill in past week 421 tons of ore; average battery assays \$7.05.

ALPHA.—The south drift from winze, 80 feet north of shaft, 550 level, is out 77 feet; face in quartz yielding low assays. The north drift, same level, is out 65 feet; face in clay and quartz. The southwest drift from Ward shaft, 1800 level, is out 166 feet; face in hard porphyry.

UNION SHAFT.—West drift, 900 level, is out west of shaft a distance of 1386 feet, having been advanced 34 feet during the week; face in clay and porphyry.

SILVER HILL.—The northwest drift, 50 level, is out from the shaft 360 feet; face in gypsum. The south crosscut, 160 level, is out from the winze 800 feet; face in hard porphyry.

CON. NEW YORK.—The west crosscut, No. 3,

140 feet north of shaft, 650 level, is out 42 feet; face in quartz, showing bunches of good ore.

BEST AND BELCHER.—1000 level—Upraise No. 1 has been carried up a distance of 11 feet; total height, 38 feet; face in hard porphyry.

GOULD AND CURRY.—200 level—South drift from east crosscut No. 1 has been advanced 20 feet through old fillings of a fair quality; total length, 73 feet.

UTAH.—725 level—At a point 252 feet from the winze station, east crosscut No. 2 has been started and advanced 45 feet in a formation of vein porphyry.

ARIZONA.

DOSORIS.—*Prescott Courier*, Nov. 21: Work in the Dosoris mine is going merrily on, and rich ore being taken out. A drift is now being run from the middle tunnel, on what appears to be a stringer, bearing to the east, ore of which is of the same character and richness as the main ledge. Printer long has discovered a ledge about six miles east of Prescott, ore of which shows considerable free gold. Greenwood, Packard & Co., operators of the Clark & Adams mill, eight miles south of Prescott, are having 25 tons of ore moved to the mill from the Shelton mines on Lyax creek, worked by them under lease. The mill will soon be started and kept steadily going. The Oro Bella mine has never looked more promising than under the management of Col. Spear, its present efficient superintendent. A two-foot vein of \$60 ore has been recently been struck in the lowest levels of the mine, and the outlook for a flourishing mine at that point is most promising.

BRITISH COLUMBIA.

INTEND TO MAKE A TEST SHIPMENT.—*Hot Springs News*, Nov. 11: The owners of the Le Roi, a Tail Creek claim, shipped in a carload of supplies last week, sufficient to carry them through the winter. Ten tons of ore will be shipped to Butte, Montana, for a working test. Four tons were recently stoped from the shaft, about 35 feet from the surface, and from a carefully taken sample sent to Spokane the following returns were had: Copper, 6 per cent; silver, \$2.10; gold, \$60.30; or a total value of \$77.40 per ton.

A TAIL CREEK BONANZA.—John S. Baker of Tacoma and Capt. Ainsworth of San Francisco have purchased a fourth interest in the I. X. L., a Tail Creek claim, for \$5000, and bonded another fourth at the same price. If work that will be done on the claim this winter proves it to be a stayer, a ten-stamp mill will be erected on it in the spring. The ore is free-milling gold and of high grade.

COLORADO.

A STRIKE.—*Elk Mt. Pilot*, Nov. 19: A rich strike is reported from the Black Eagle mine, situated on Sheep Mountain. J. B. Wheeler & Co. of Aspen own the property, and have commenced to ship ore via Carbondale, the road to Crested Butte being closed early, owing to so little traffic over it. A body of ore seven feet wide has been discovered in the east drift from the 1500-foot level, assays from which run from 100 to as high as 500 ounces in silver. If it only holds out, this is the most important strike ever made on Sheep Mountain, and will attract widespread attention to that locality by next spring. A new trail is being made to the mine from the wagon-road at Lizard, so that the route will be somewhat shortened and ore packing will be kept up as long as the season will permit.

DAKOTA.

WELCOME CHLORINATION WORKS.—*Deadwood Pioneer*, Nov. 19: It is learned that arrangements have been made by the Welcome Chlorination Works with the Elkhorn Railroad for the transportation of ore from the mines to Rapid. The rate from Bald Mountain to Deadwood will be 75 cents a ton, the same as is now charged. From Deadwood to Rapid the rate will conform pro rata with the rate to Omaha. This will bring it to 50 cents a ton, and the chlorination works guaranteed to ship ore to such an amount that the minimum cost will be \$12.00 per annum.

SPRUCE GULCH.—Recent developments in this district, which lies only a few miles from Deadwood, have brought it into some prominence. Two good prospects have been opened—one by Cy. Robbins and the other by H. C. Dunn—besides some other mines that are equally prominent. There is in both of the above claims a vein of galena and pyrites, which is intermixed with zinc. The grade of the ore is low, although carrying considerable lead. Besides this, there is some dried ore carrying about 20 per cent, and on account of its proximity to reduction works, the district will prove valuable in the future.

IDAHO.

NEW POWER.—*De Lamar Nugget*, Nov. 19: Three short, quick toots of the mill whistle at 8 o'clock last Tuesday night brought everybody in town to their doors, thinking it a fire alarm. There was for a few moments a splashing through the mud as the people ran for the hose-cart and fire plugs; but it turned out that the whistle was only saying "Hip, hip, hurrah!" to celebrate the hitching on of the big engine to the mill machinery, and the mill started up again, after less than 24 hours shut down, with entirely new power to drive it. The two smaller engines, which had to be run with quick motion, are now retired and the new Corliss now does the same work. The long crosscut tunnel being run to cut the Garfield has not yet reached that vein, but last week cut an eight-inch blind vein of good ore. Arthur Neal, discoverer of the mining district bearing his name, which created such a stir in Mountain Home, has sold two of his claims—the Homestake and Mountaineer—for \$45,000. The name of the purchaser has not been made public. This district is situated some 25 miles west of Mountain Home. Several valuable claims there are owned by De Lamar parties.

BAYHORSE.—*Ketchum Keystone*, Nov. 14: Bayhorse will enjoy a more prosperous season this winter than the little camp city has experienced for several years. A. J. Crook, manager of the C. M. & S. Co.'s mines, is having a road built from the Skylark to connect with the wagon-road at the terminus of the pack-trail, so that he may ship ore

all winter by sleighs. Mr. Crook intends to employ about 30 men at the Skylark, the present force being 65. The inexhaustible Ramshorn will employ a larger force this winter than it has for several years. There are two Post Boy tunnels under contract now that will work about 20 men all winter. The Silver Brick will keep a force of eight or more. Besides the above mines, there will be considerable lease work done. In all, we think it will be safe to estimate that there will be at least 100 men employed. There will be no "draughts" made much before Christmas, so the mines will be worked with reduced forces only three months.

LOWER CALIFORNIA.

ALAMO.—*Lower Californian*, Nov. 13: Work is going ahead lively on some of the mines, notably the Princess and the Aurora. Both of these mines are on the same ledge at the foot of Tomasa hill, overlooking the town, and their shafts are but a few rods distant from each other. Just now the Aurora is in bonanza, the ore taken out showing free gold in large quantities. The shaft is 170 feet deep and sinking will go on to a depth of 200 or 300 feet more. Both the mine and the mill of the Aurora company are working seven days and nights in a week, and it's the general supposition that the owners, Messrs. Russell & Rhodes, are making money fast. The Princess mine is in some respects the best in the camp; its machinery is more extensive than on any other, and everything done on the property thus far shows the ability of the superintendent, Captain W. H. Rodda, and his thoroughness and attention to details. A visit to the bottom of the Princess shaft showed the Burleigh air drill at work under the direction of foreman Dennis Kane. The drill was at work in a granite dike, but had no difficulty in boring a three or four foot hole in a few minutes. Men are at work drilling in the southern end of the 100-foot level also, and through 20 feet of solid rock the Aurora's men can be plainly heard drilling in their mine. Eight-hour shifts keep the mines and mills running constantly. The mines up on Tomasa hill, several of which are owned by A. H. Butler, are among the best in appearance in Lower California. The ledges are large and distinct, and will some day doubtless be proven rich. The best and most complete mill plant is that of the El Paso company, but there are others in the camp well fitted up and doing good work.

MONTANA.

MINES OF MAIDEN.—*Cor. Montana Mining Journal*, Nov. 18: The altitude of Maiden is 4256 feet. The town has a pleasant location and a better grade of buildings than most mining towns. The mining interests are on the upward tendency. W. H. Burgess has the Maginnis 10-stamp mill leased for eight months. The plant will be used for treating the ore from the She and Last mines. The developments on the She consist of 150 feet of tunnels, from which has been taken about 150 tons of ore of a free milling character that averages \$65 per ton in gold and silver. The Anna B. has a shaft 50 feet in depth, from which has been taken 75 tons of low-grade ore that will pay the expense of developing. The Sheep Mountain and Great Northern make up the remainder of the group that will be worked. Mr. J. Moorhead, assayer for the Spotted Horse company, has secured a lease on the South Mountain, one of the Maginnis mining properties. The ore will probably average \$50 per ton. The air is good and the mine dry, and there is no scarcity of men. The Cave Mining Co. has three claims, the Cave, Golden Gate and Horseshoe Fraction. The Cave is patented and is owned by residents of Fergus county. The Cave mine is so named from a cave 100 feet long and from 10 to 15 feet high and 10 to 20 feet wide that showed galena all through. A tunnel 175 feet long has been run from the side of the hill so as to tap the back end of the cave 12 feet below its surface. One hundred feet of this tunnel is run on an ore body 10 to 12 feet wide which gives 80 per cent of lead and 12 ounces in silver for first grade, the second grade carries 25 per cent of lead, 20 per cent of iron, 8 ounces of silver. The mine is easily worked, two men taking out 15 tons a day. The Wicks coal mine is operated by P. Saunders, who commenced cleaning out the mine the first of October. He is now taking out three tons per day.

NEW MEXICO.

BONDED.—*Silver City Enterprise*, Nov. 20: The Silver Bell mine at Pyramid has been bonded by the Pyramid Silver Mining Co. Supt. Hamilton will put a force of men to work immediately, opening up the property and taking out ore. The mine has a shaft 90 feet deep which shows up considerable high-grade ore, as well as large quantities of medium grade. The Bremen mill has turned out 14 bricks from custom ore in 19 days this month, up to last night, and yet the croakers say there are not sufficient resources in the vicinity of Silver City to maintain a city of large size. Thirty-five tons of ore a day at the Flagler works, a \$7000 brick every day from the Bremen, and still not sufficient capacity for the reduction of our ores, thousands of tons being shipped to Denver, Pueblo, Socorro and El Paso. Every dollar being spent in the county is coming out of our mines and the amount of money in circulation in Silver City is greater per capita than in any town in the west. Dolan & Co., lessors on the St. Louis mine at Pinos Altos, made a strike last week fraught with importance, and of great significance, when considered in connection with the many different limestone areas within a radius of ten miles from Silver City. These men, who are practical miners, with much experience in limestone districts, leased the property with nothing in sight. For six months they have worked faithfully, risking their time, money and labor on their belief in the existence of good ore at the contact. Staking all they had on their opinion formed upon the result of former experience in similar formations, they followed a small seam of iron carbonate, which at a depth of 75 feet opened a chamber of ore, the extent of which is not yet made public. The ore is a heavy galena, assaying 97 ounces silver and 46 per cent lead. The boys have a bonanza in sight.

OREGON.

BAKER COUNTY GOLD.—*Bedrock Democrat*, Nov. 20: During the past 30 days the Democrat has frequently noted the arrival in our city of more

or less gold bullion from the mines adjacent to Baker City, to be sent by the banking institutions to the U. S. Mint for coinage, and yesterday the idea occurred to the reporter that the people, even our own citizens, had but a faint idea of the sum total of the output of the mines, and he concluded, if possible, to make the effort to obtain some accurate estimate of the amount. Application was made at the banks, and the cashiers readily gave the following figures:

Amount of gold-dust and bullion received and shipped by the Baker City National Bank during the month of October, 1891.....	\$38,723 60
Amount of gold-dust and bullion received and shipped by the First National Bank during the month of October, 1891.....	\$8,000 00
Total.....	\$46,723 60

From the two banks \$74,723.60. In addition to this, the Pacific Express Company has shipped from its office in this city many thousands of dollars which did not pass through the banks, and private individuals have shipped more or less away to the mint, that no correct account of can be obtained. It is, however, safe to say that the amount of gold sent away from Baker City within the past 30 days would reach the large sum of \$100,000.

WHITE SWAN BULLION.—*Bedrock Democrat*, Nov. 20: Five hundred and twenty-six ounces of gold bullion in 13 days. That is the output of the White Swan mine, and the amount in dollars is about \$10,000. This large amount of gold bullion, just as it came from the retort, was on exhibition all day yesterday at the Baker City National Bank.

MORE GOLD.—There seems to be a rivalry between the mines of Baker county as to which will contribute the most of the golden product. Hardly a day passes that the Democrat is not able to chronicle the arrival of thousands of dollars from the mines adjacent to Baker City. First, it is the Baisley-Elkhorn and following in rotation as monthly contributors are the Robbins-Elkhorn, the Nelson, the Sanger, Waite Swan, Bonanza and others. Yesterday Mr. Albert Geiser, manager of the Bonanza, in the Robinsonville district, arrived in the city with his valise loaded down with bullion, and soon after he put on exhibition at the First National bank 275 ounces of the precious metal, valued at \$16 per ounce, or \$5400, the result of 23 days' run with a five-stamp mill.

THE CHLORIDE MINE.—The Chloride M. & M. Co. have been quietly working their property at Rock Creek this summer with day and night shifts. There is not less than \$250,000 worth of ore now on the dumps and exposed in the openings between the 100 and 300 foot levels.

WASHINGTON.

CONCONULLY.—*Cor. Seattle Mining News*, Nov. 12: The Lone Star has a 15-foot ledge and the owners have spent \$12,000 on it. It is now closed down while the concentrator is being put in better shape by adding new machinery to test the ore. The contract for the 240-foot tunnel on the Salmon Creek has been completed. The John Arthur, owned by J. T. McDonald, is working constantly on fine silver glance ore. The assessment work on the Lady of the Lake has been completed. Ores from this district are hauled 100 miles and then shipped by rail more than 500, which is proof of their high-grade character.

PALMER MOUNTAIN.—The mines in the Palmer Mountain district are in first-class shape. A new strike of \$2000 ore was made a short time ago in the War Eagle, the ore getting richer with depth. The Ivanhoe, which has reached a depth of 140 feet, continues to ship to Tacoma. The rainbow, bonded for \$100,000, produced \$72 from 1½ pounds of ore. The Buckhorn produces considerable native copper. It is developed to a depth of 120 feet. The Julia has a shaft 100 feet deep and the Frisco 80 feet, both showing good ore. The Dexter is shipping a sulphuret ore to Tacoma. It is owned by Hanly, Dudley and Brown. The latter went to Tacoma last week with a shipment.

BONDED.—*Okanogan Outlook*, Nov. 13: One of the most important mining deals of the season was consummated in this city Monday with the bonding of the recently discovered gold claims on Cecil creek. There are two claims included in the transfer, the Red Jacket and White Face. \$20,000 is the price to be paid for the property on a bond of 12 months. It is currently reported here that Mr. Andrews, who bonded the claims, is representing a syndicate of mining men headed by Jim Wardner, of Coeur d'Alene notoriety. The claims were discovered only about three months ago by Messrs. Redmond and Hedrick, and the only development done was performed by nature, in the shape of a deep open cut where the creek crosses the ledge at right angles. Near the bed of the creek a two-foot hole was sunk on the ledge, which is solid ore and two feet wide. A number of assays were made which went all the way from \$125 to \$371 in gold per ton.

UTAH.

ELECTRICITY APPLIED TO MINING.—*Park Record*, Nov. 21: R. M. Jones, the electrician of Salt Lake, is now doing some figuring on placing mining machinery in the Park which shall be operated by electricity. Mr. Jones says he thinks it is only a matter of a few years until all the leading properties in the camp will be using electricity as a motive power and to light the various stations and drifts.

METROPOLITAN STONE CO.—The Metropolitan Stone Co. is rushing matters in connection with the switch to their quarry. Ground has been broken and the grade is now being constructed. Ties have been purchased and four cars of rails arrived this week. The Ontario drain tunnel is now in about 10,000 feet and is being driven ahead rapidly as the force is now in good driving ground. For a distance of about 60 feet this week the entire bottom of the tunnel had to be cut out and lowered, as it was found on survey to be a trifle higher than the grade allowed.

THE SALTON LAKE, on the Colorado desert, San Diego county, is drying up. A great stretch of the desert which was submerged is now dry, and is covered with a glistening coating of salt. The salt company will resume operations very soon, taking chances on the water coming in again at the high-water season next year.

MECHANICAL PROGRESS.

The Training of Mechanics.

The lack of thoroughly trained artisans in the various trades is one of the greatest drawbacks on the progress of American industry. We have very few apprentices nowadays. Boys usually "pick up" trades. Not one in a hundred of our alleged "masters" of trades of American birth has had any systematic instruction. The most of our best trained mechanics are of foreign birth and learned their trades in foreign shops. The "ironclad" rules of the "Trades Unions" render it impossible for any considerable number of our American boys to learn trades in the regular shops. The result of this has been to create a wide demand that the deficiency be made up by training boys in the rudiments of mechanics in the common schools; and there have sprung into existence many college annexes, where the scientific principles of physics are taught in connection with their practical application.

Every section of the country ought to encourage every movement intended to train our youth in handicraft, and every large city in the Union ought to have one or more technological schools similar to the Sheffield annex at Yale, and the scientific and practical schools at Cambridge, that are under the control of Harvard. A contemporary, in alluding to this matter, makes reference to the magnificent bequest of Mr. I. V. Williamson, a wealthy philanthropist of Philadelphia, who has determined to found a free school for the training of boys in all branches of mechanical business. He will put into the enterprise at the start \$2,500,000 or \$3,000,000, and if the school meets his expectations, or comes near doing so, he will liberally extend and endow it by donations in his will.

Mr. Williamson's plan is not to establish a "Manual Training School" as that term is generally understood and as it is exemplified in many of our public school systems. Such "training schools" come very short of the requirements necessary to turn out such workmen as are sought for and must be had in order to carry on in a successful manner the great workshops of the present day, which are so immeasurably in advance of similar establishments as they existed fifty years ago. The intention of Mr. Williamson is to teach boys thoroughly in the mechanical trades, in order that when they enter upon life they may be able at once to secure employment. He deprecates the tendency of the day to despise hard labor, and thinks that the condition of the laboring class will be immeasurably improved if the workmen are bred up from boyhood to take pleasure and satisfaction in their work. It is with this view that he will establish his school, and the common belief is that he will give a large part of his fortune to place it on a firm basis and secure permanence.

It is to be hoped that when the Stanford University of this State is fully under way, it will accomplish, as a part of its work, the purpose which has been outlined by Mr. Williamson. By so doing he will render it possible to fill our California shops with those who have been "to the manner born," and make useful to themselves and the State thousands who would, under the present condition of things, become a burden to themselves and a possible detriment to the public.

BRIDGES OF RAILROAD IRON.—Old rails bid fair to come into valuable use for a new and most unexpected purpose—the construction of bridges. A bridge of this description (being the third of the kind) has recently been built over the Pequabook river, near Terryville, Conn., which is said to be stronger than a wooden bridge and much cheaper. With the exception of a few special castings and rods, it is built entirely of cast off railroad rails. It is a truss bridge, having a span of 19 feet; the roadway is 30 feet wide, and a sidewalk eight feet wide on one side, the whole being covered with concrete. The bridge rests upon stone abutments, on each of which an iron rail rests and forms "mudsills." Upon these the stringers, which are also iron rails, are laid. Of these there are 15 in the bridge, placed at equal distances of 2½ feet apart. Another rod, or "spindle," across the center, under and at right angles with the stringers, is supported by iron rods depending from the trusses, which also support the bridge. Each of the trusses is formed of two rails, the ends of which are fitted into solid iron castings made of special shape to receive them, and meeting at the center of the bridge are also held together by similar castings, through which the iron rod extends, and braces extending on each side to the end of the spindle give strength as well as rigidity to the structure. Heavy plank covered with concrete forms the floor of the structure.

IRON MELTED BY ELECTRICITY.—We have already alluded to experiments which have been made to melt iron by electricity. It is now reported that Alvin Dings, electrician, of Milwaukee, has just perfected a method by which iron can be so melted at much less cost, and in half the time required by the present process. By the new method the melted iron is secured in a condition much purer than in the old way. This is the process: Electrical connections are made to the anodes in which the iron to be melted is placed. Then a strong current of electricity is sent through the iron forming arcs at each electrode. This produces an intense heat, which melts the iron rapidly.

A RECENT MECHANICAL EXPERIMENT for duplicating a croquet ball by hand in an ordinary wood-turning lathe, proved that the simplest method of turning a sphere consists in placing a square piece of wood against the face plate of the lathe, and holding it by pressure from the tail stock, turning carefully, as near as possible by the eye, then with a lead pencil making a mark around the center of the ball, removing the block from the lathe, and turning it about one-fourth way round, when it is to be replaced in the lathe and light chips taken off until every part of the pencil mark is removed. This brings the ball to a nearly perfect state, which is assured, if possible, by making one more change of center. The special point in this method is that the mark made with the pencil around the center of the ball is a perfect circle, and upon changing the axis of the ball and working to this circle, the perfect circle becomes the perfect sphere.

WIRE NAILS FROM STEEL PLATES.—We learn from Eastern papers that an invention has been introduced by which wire nails can be made from steel plate. It has hitherto been considered impossible to cut wire nails from any other material except wire. The cost of changing an ordinary plate machine to one for making a wire nail is very small, and it is said that the adapted machine turns out nails at the rate of 250 a minute, and that the heading die performs its work better than characterizes the ordinary apparatus. The nails by this method are represented as thoroughly well made, well pointed, and with large heads, and without any indication of splitting. By changing the space block, four, six, eight, and ten penny sizes can be made, and the capacity of the device for wire nails is said to be from 40 to 50 per cent greater than the common wire nail machine.

A HOUSE MADE OF COPPER.—N. Poulson of Brooklyn, N. Y., has had a dwelling-house constructed mainly of copper. It is said to be quite a marvel. It is all of metal, on a light framework of steel, the floors being supported by arches. The walls are composed entirely of large copper plates riveted together with double seams and bound with iron. The cornices, the trimmings, the posts, the railings and the sheathings are entirely of iron. The copper is not polished, but each plate is set in rough-hammered. Each plate makes a panel with the iron linings. In three of these panels brass medallions are set in bas-relief. On the two tall brick chimneys are iron bas-relief work, one figure representing a phoenix. The style is Queen Anne, and time will color the whole structure in a rich copper hue.

A NEW MODE OF FASHIONING COAL-DUST FUEL.—In England, where pitch or other bituminous material is expensive, briquettes for fuel are formed by the use of glutinous or farinaceous matters, such as are obtained from wheat, barley, rye, or other cereals, or vegetables—57 per cent to 95 per cent of coal dust being a suitable proportion. The mixture kneaded, sets in a short time, so that molding under pressure is unnecessary, although the use of molds may be adopted to aid rapid manufacture. It is claimed that the product burns with less smoke than the ordinary briquettes, and is more economical in use. Refuse matter from coal fires, with or without fresh coal, may also be utilized.

CURIOSITIES OF IRON WORKING.—Add carbon to pure iron and it becomes steel. Add a hydrocarbon to iron, and steel itself becomes so extensively modified that its properties are not recognizable. Thus steel may be as soft as pure iron. Add hydrogen in varying quantity and it has the quality of resilience, as in the watch spring, or in the quality of tenacity, as in the knife or razor, or may be given nearly the hardness of a diamond, as in a file. With steel at a low temperature, from 405° to 450° F., edge tools are produced, the color in the yellow shades; from 500° to 525°, various sorts of springs are produced, color, blue; while by heating iron to whiteness and plunging it into water, which is mainly composed of hydrogen, files are produced, or forms even harder.

HARDENING TOOLS.—It is said that engravers in Germany harden their tools in sealing wax. The tool is heated to whiteness and plunged into the wax, withdrawn after an instant, and plunged in again, the process being repeated until the steel is too cold to enter the wax. The steel is said to become after this process almost as hard as the diamond, and when touched with a little oil of turpentine the tools are excellent for engraving and also for piercing the hardest metal.

THE TWISTED WIRE NAIL.—A cross between a screw and the ordinary plain wire nail—is working its way into popular favor, and is believed to represent as great an improvement upon the plain wire nail as that useful invention did over the old cut nail. The twisted wire nail not only crushes the fibers of the wood less than the two other forms of nail, but by its screw shape possesses a much greater holding power than the other forms.

A MUCH NEEDED INVENTION.—A shipping journal says that there is a good opening for an ingenious American to discover, patent and place upon the market an automatic ship scraper for cleaning the bottoms of iron and steel sailing ships when under way. A wide application could be made of a convenient and portable device of this description.

SCIENTIFIC PROGRESS.

Whence Comes Intuition?

The question is often asked—Are there any innate ideas?—any indubitable evidences, on record, of any such functions directly pertaining to the mind or brain. That is—whether the brain is but the instrument of the mind—whether, in its throbbings it thinks, of itself, and thinking retains ideas any more than when the eye sees or ear hears, those organs retain impressions. Mr. John E. Methven, a correspondent of the *Phrenological Journal*, discusses this problem as follows:

It is a question whether the brain is but the instrument of the mind; whether it retains ideas or impressions any more than the eye or ear does.

To me it seems that it is the mind, whatever that is, looking through and permeating these organs, that thinks, sees, hears and retains impressions. If this view be correct, it follows that mind precedes brain, and that the latter is a result, a necessary instrument of mental action, through which the various phenomena of the mind are displayed. This implies that the principle or essence of mind is a separate entity. However that may be, it is true there is something, called mind, which is dependent for expression on the potency of external influence and without which mind has no existence; just as there can be no sound until vibration impinges on the drum of the ear.

Mind so constituted, not unlike the spark evolved, from the concussion of steel and flint, has the power of generating thought; and by heredity, in a measure, conditions being favorable of transmitting acquired—not innate ideas. The limitations of mind, ancient ideas, may be illustrated thus:

Suppose a child born of intellectual parents, were, if possible, isolated from human society until adult age; it is impossible to conceive that such a being so deprived of human association could speak, think, or transmit ideas, save, perhaps, of a vague sort, and that might be doubtful, from the fact that from infancy the brain had been in an inactive, abnormal condition; but more from the absence of the essential elements, as noted, that enter into the constitution of active mind. It is apparent from this view of the question that the unseen something, if non-existent, is at least quiescent until it is evoked by the potency of circumstances and the influence of experience. How these operate is unknown.

It may be suggested that ancestral experience imprinted on the retina may call up dim visions; probably they may do so in some peculiar cases. No one doubts that past experiences in a general way are transmitted and aid human progress. But how rare are the instances of ability or genius in linear descent, as far as can be traced, transmitted from parent to child.

But, on the other hand, it may be asked, What of the musical performances of a "Blind Tom" or of the intuitive calculating powers of a George Bidder, who in quickness and accuracy outvied learned arithmeticians? And what, too, of the amazing knowledge Shakespeare possessed of human nature, seemingly, as it were, by pure intuition? These and like exhibitions of mind, as seen in some departments of art and science, seem to approach very near intuition, or perception come by a mysterious strain of natural differentiation. After all, such instances seem but to imply that there are conditions of susceptibility in the unseen which now and then, from unknown causes, become excited into unusual brilliancy.

While it is pertinent to inquire if there be innate ideas, is it not equally so as to the origin of ideas and faculties, not innate, therefore acquired, and how so? And the inference comes that where there is animation there is instinctive emotion, feelings of pleasure and pain, which it is fair to assume are the initial premonitions of mind. Thus it would appear that life and mind are nearly coeval, and both have risen up by the aid of circumstance and experience as means in evoking inherent forces.

Varied conditions and dissimilarity of experience form character, bringing to the surface inborn powers, as exemplified in the pioneers of civilization, and at the present day in men of commanding intelligence, who are the leaders from low conditions to higher planes of being.

The primitive savage perpetrated indiscriminate attacks on the rights of his fellows. Indeed, might was right until a clearer, higher order of brain taught that such conduct was wrong, in that it destroyed the unity and harmony necessary to human well-being and happiness. Thus the sentiment of right-justice dawned, and has grown to the proportions and forms which the phrenologist has denominated conscientiousness.

In like manner, may it not be that religious sentiment, based on fear of the unseen Powers, has grown? Optimistic views coming into activity that comprehended the higher purposes of life saw only manifestations of love in the universe as in the heartless of spring, in flowers, autumnal fruits, and in the many other blessings of life, for which men reverently rendered thanks and adoration. From simple beginnings the faculty of veneration, in its highest form, as worship for the Great Supreme, may have grown.

So of benevolence, hope, ideality, wonder. There is that in the human mind which addresses nature, thence obtains ideas, formulates

conceptions, looking to life and mind, their origin and phenomena. It asks why do these phrenological indications have a place in philosophical inquiry? The reply is, because they are true to nature, and that such knowledge is instructive in this: "Man, if thou wouldst understand, learn to know thyself."

THE CAUSE OF COKING IN COAL.—At the first glance it would seem strange, but it is nevertheless true, that the physical cause of the coking or fusing of bituminous coal into the form of coke, under a distilling heat, is by no means understood. By some German chemists a test has been made to connect the physical phenomenon of coking with the chemical composition of the coal, especially with reference to the richness of the coal in what is called disposable hydrogen or that proportion of it which is in excess of the quantity required to form water with the oxygen present. Unfortunately for the general acceptance of this standard for the coking quality in coal, it does not correspond with observed results. Neither does the richness of a sample of coke in carbon determine its coking capabilities; for two specimens of coal of practically identical carbon composition will often be found to behave very differently in the retort of coke ovens. If the property of coking does not reside either in the surplus hydrogen or the fixed carbon, it is certainly not to be found in the content of the coal in oxygen, which gives no indication whatever of the physical behavior of the coal under heat. Some coking coals coke without much swelling; others swell considerably in the process of coking. In either case, the coal must undergo a stage of fusion, in which it becomes a thick semi-fluid mass through which the gas escapes. Why one kind of coal should swell considerably while another variety, of similar composition, does not, is a problem not apparently capable of solution from any of the chemical data usually preserved in analyses of coals.—*Journal of Gas Lighting.*

WHAT IS AMMONIA?—The existing war among the baking powder manufacturers, and the consequent newspaper talk in regard to the same, has induced the inquiry among the multitude as to what this poisonous ingredient really is, and why it is poisonous. A contemporary answers this inquiry as follows: Ammonia is the most common and the most easily produced poison there is. It produces itself. It is a product of decay, and is thrown off by the decomposition of all organic matter. Water which contains a large amount of sewage contains a proportionate amount of ammonia. Every cesspool is an ammonia factory. Ammonia was originally obtained from camels' dung, and for ages this was the only source. It may also be produced from putrefied urine. Patents have been applied for with the view of utilizing the refuse from the large stockyards and stables for its production. Ammonia of commerce is now made from gas liquor. The recent discussion of the dangerous qualities of ammonia comes from the alarming increase of its use as an adulterant in certain food productions. People who absorb it in small quantities from day to day suffer from slow ammonia poisoning. Taken internally in sufficient quantities, it eats away the coatings of the stomach and intestines and causes death. Slow ammonia poisoning produces various forms of stomach trouble and causes the complexion to lose its freshness.

SEARCHING FOR A SECONDARY SATELLITE.—The astronomers at Harvard improved the occasion of the favorable conditions under which the late eclipse of the moon occurred, in that locality, to determine if possible whether that orb has a satellite. The search was made by means of a prolonged photographic exposure during the time of totality. An exposure of ten minutes, under the most favorable conditions, failed to reveal any such body. The observatory at Arequipa, Peru, which is working under the direction of Harvard, was instructed to make the same search. As this observatory is most favorably located, and in an almost cloudless region, much interest is felt as to the results at that point.

TERRESTRIAL MAGNETISM AND SOLAR PHYSICS in their relation to meteorology, is to be made the work of a special department in the Weather Bureau. Prof. Frank H. Bigelow, late assistant in the "Nautical Almanac" office, will be in charge. Prof. Bigelow's recent discoveries regarding the solar corona and terrestrial magnetism especially fit him for this post.

A MOST REMARKABLE ALLOY of gold and aluminum is now under the examination of scientists. It is of a beautiful rich purple color. This new royal metal will make a handsome addition to those now used for purposes of adornment. From all accounts, it seems amenable to the methods of jewelers in making their gold ornaments.

THE LAW OF EVOLUTION works in language as well as in other things. Twenty thousand words have been added to the English language in the department of biology alone, since Darwin's discoveries.

VEGETATION IN MINES.—In an English coal mine, plants have grown at a depth of 1000 feet. They were perfectly erect and vigorous; but their foliage was blanched from the lack of sunlight.

ELECTRICITY.

Electricity Made Perfectly Safe.

Have We an Edison on the Pacific Coast?

Novelties in electric engineering come so thick and fast upon us that it requires the constant and closest attention of even an expert to keep fully abreast of electrical progress. Studies in the direction of safe and economic transmission seem just now to be the rule. We have already made allusion to an alleged important discovery in these directions in Oregon. Mr. F. J. Crouch, a young electrical engineer of Eugene, has been for four years engaged in close study and experiment in efforts to devise a perfectly harmless dynamo which, with its connecting wires, any person may handle without fear of danger. He has spent all the money he could command, some \$6000, in these experiments, and, so it is claimed, has at length succeeded in his efforts. The machine is described as being very simple, while the chief secret of success has been found in the winding, induction and proportion of metals. There is another secret which he will not divulge.

Most Extraordinary Tests.

According to the *Oregonian*, Mr. Crouch recently gave his invention some severe tests in the presence of several people, including a reporter of that paper. His principal purpose was to show that his machine was harmless and that it was impossible to get a shock from it.

"Do you think I can do it?" he asked of those around him.

A dubious look crept over the faces of all in the party. No one would volunteer to be the subject of a test, so Mr. Crouch volunteered. Mr. Crouch then took two naked wires from the terminals of the dynamo and placed them in his mouth. If he had fallen dead no one would have been surprised. He kept the wires in his mouth a moment, and, removing them, said calmly that he had not been shocked. The only thing that he felt was a tickling sensation of the tongue.

"Probably there is no power in the wires," one of the spectators suggested.

Mr. Crouch smiled and released a 16-candle power incandescent from its attachment. Then he put the wires into his mouth again, crossed them and connected them with the incandescent lamp and a bright light shone from the globe. Then the inventor placed his hand on one of the brushes and a spectator took hold of the other and the two joined hands. Mr. Crouch broke the current repeatedly, but neither he nor his friend was in the least affected. Mr. Crouch explained that his machine required an absolute metallic circuit or it would not work. Other machines ground and become useless with this kind of circuit. The inventor then wrapped each of the wires around a piece of carbon, and placing his hands around the naked wires brought the points of the carbon into contact. The result was a 2000-candle power arc light, which shone with dazzling brilliancy. Previously Mr. Crouch rubbed one of the wires on a carbon which was connected with the other wire and the first wire melted.

Another feature of Mr. Crouch's exhibit was a 16-candle power light burning in a jar of water, the naked wire being exposed to the water. Right above the jar was a light and an electric bell on the same circuit.

A telephone instrument has been worked a distance of three or four miles on the same line as an electric light without damage to either branch of the service.

Again, the incoming and outgoing wires of the dynamo have been run without insulation through mud, and have then started lights without any loss of power. Mr. Crouch says his dynamo has the power of ten volts. It will run fifty 16-candle power incandescents with 4-horse power, including friction. In inventing it Mr. Crouch says he has cast aside all the theories of construction of electrical machines and started on a new track.

If there is no mistake in this report Mr. Crouch is a full rival of Edison. The last of his tests are directly in line with the latest and most wonderful achievements of the "wizard of Menlo Park," as already described in these columns. The question naturally arises, Have they both struck upon the same device?

A SAFETY WIRE FOR MINES has been devised which does not throw a spark when by any accident the wire is broken. The secret of the invention consists, practically, in transferring the breakage of the wire to some place at the top of the mine, where its action is not important. The wire or cable contains an inner core of closely coiled spiral wire insulated by braid, and an outer core which is joined in parallel with the inner. In case the cable parts, the inner spiral pulls out to a considerable distance and takes the whole onrrent. As soon as the exterior main is broken, the fuse at the switchboard burns out and releases a switch which cuts out the whole current. In case the wire should be completely severed, as by an ax, thus crushing the two conductors together, a small resistance coil is placed in the circuit, and any contact between the two wires causes the fuse to melt as before. The device is especially valuable in coal mines, where explosive gas is occasionally met with.

A NEW ELECTRIC BATTERY.—Mr. John Baldwin, an English inventor, thinks, if he has not found perpetual motion, he has certainly discovered something very near to it.

He has patented a new electric battery, in which, instead of using zinc, he has hit upon a solution which, he claims, is seven times as powerful as the zinc battery. The chief peculiarity of this battery, as claimed, is that its power grows gradually less in a few hours of use, but returns to its original unit when allowed to rest a few hours. Two batteries are so arranged that the power is shifted from one to the other every three hours. Suppose it is desired to run a motor which requires ten units of power, take a battery which, when rested, gives 15 units of power; when use has brought the power down to ten, the current itself operates an automatic device for changing the batteries, and the new one, also of 15 units, is shifted in the place of the weaker one. That, in turn, runs until the power goes down to ten, when the rested one takes its place; so on ad infinitum. Such a machine would certainly come very near to perpetual motion.

THE METROPOLITAN ELECTRIC RAILWAY of San Francisco, to run from junction of Market and Mason to the ocean beach, by way of the Park, will be ready for operation in about three months. It will reach the Park at the Olympic Club grounds, at which point work will cease for the present until further improvements have been made along the sand dunes between there and the beach, and until reasonable arrangements can be made for the right of way through the south-side property. President Mayne says that contracts have been made with the Thomson-Houston Co. to set up the electric plant. The overhead system will be used. As the franchise was granted before the Board of Supervisors passed the ordinance prohibiting the erection of poles and stringing of wires in the district east of Eleventh and Van Ness avenue, the company expects no trouble in this respect. A Golden Gate avenue over-builder has the contract for building the cars. There will be no double enders. The cars will be similar to those used on the Ferries and Cliff House cable road—an open dummy at one end.

LOOKING FOR POWER.—The capitalists of San Jose are just now much interested in the cheapest and most practical way of obtaining an unlimited source of power for generating electricity. The success of the recent mode of long-distance transmission of power, as demonstrated in Germany, in the opinion of some, warrants the attempt of utilizing the distant falls of the Merced river, when there can be no practical limit to the extent of power. Others think that Coyote creek, at Glen Willows, a nearer point, only 20 miles away, will furnish all the power needed, as the watershed which furnishes that power is fully 200 square miles in extent. The sum of \$750,000 will be sufficient to utilize the latter, while a much larger amount would be required for the former. The San Jose Chamber of Commerce favors the Glen Willows project, and has appointed a committee, consisting of Dr. E. A. Clark, A. P. Hill and W. C. Winter, to inquire thoroughly into the matter.

THE OVERHEAD SYSTEM.—The Southern Pacific Company has decided to employ the overhead system for their Telegraph Avenue street-car line in Oakland. Their first inclination was to employ the storage battery systems, but upon the report of agents sent East to look into the matter, have finally decided as above. This is one of the very few horse-car lines still in operation in Oakland, and the citizens of that place will be rejoiced to greet the completion of the coming change. Work upon the road will be prosecuted diligently, even through the winter, until the new system is in full operation. When this road is completed to Berkeley, the double-fare charge between the University and Oakland will be done away with, and five cents only will be required for fare between the two places.

THE NEW TELEPHONE INSTRUMENT, which was recently announced as an invention of a citizen of this State, and which it is promised will work a complete revolution in the whole system of telephoning, seems to be still in abeyance. It is but justice, we presume, to wait for developments, which we trust will eventually prove all that its sanguine inventor and his friends have claimed for it. It will be recollected that "Lukey Baldwin," of this city, was the chief broker of the inventor, and it is to be hoped that Mr. Baldwin's luck will not forsake him in this, his latest venture.

FROM SAN JOSE TO PALO ALTO.—There is serious talk of an extension of Mr. Henry's San Jose electric railroad from Santa Clara to the Stanford University. Such an extension would be of great value to San Jose and vicinity, which will soon be entirely covered with a large population which will be greatly benefited by a close connection with the University.

ELECTRIC RAILWAYS IN PORTLAND, OREGON.—Electricity as a motive power for street railways has been used in Portland, Oregon, since 1889, and an aggregate of some 33 miles of track is now in operation there. In addition thereto 32 miles more of horse railways is either actually being converted into electric roads or is under proposition to that end.

ELECTRIC RAILWAY IN SAN DIEGO.—The entire system of the San Diego horse-car lines has been purchased by A. B. Spreckels. He will at once convert the main portion of the system into an electric railway.

GOOD HEALTH.

School Study and Curved Spines.

There is quite too much inclination among most people to make light of the charge that our school children injure themselves by too much study. This matter ought to be fully set at rest by the following paragraph: At a recent meeting of the Collegiate Alumnae called to consider the question, "Should Physical Training be Required for Girls in Colleges and High Schools?" Walter Magee, Professor of Physical Culture at the University of California, made the startling statement that in a recent examination given by him to a large ladies' school of good physical average, 33 per cent were found to be suffering from curvature of the spine, and 50 per cent had hollow chests and shoulder deformities.

The cause of this deplorable state of affairs is by some attributed to a lack of proper exercise in well-arranged gymnasiums. But those who have inquired closely into the matter think that there is no remedy for this evil except in a thorough change in our educational requirements.

Shoulders are rounded, spines bent and the nerve forces exhausted by overstudy; and some of our girls are even sent to insane asylums in consequence of the pernicious system of cramming so much in vogue.

A correspondent of the *Morning Call*, in commenting on the above, writes as follows:

When students remain at their desks for five hours a day, and pore over their books four or five hours more every night, it will need more than a puny attempt at gymnastics for half an hour daily to correct the harm done them. If the girls were given no home study or even a reasonable amount, they might have time for "recreation" and physical culture if they choose.

It is well known that physical work and mental work are supplied from the same nerve force. At the Stanford University this fact is recognized. Dr. Wood, who has charge of the gymnasium in that institution, says that physical training is elective and counts for a degree as a regular study. Exercise is something, but rest—opportunity for the renewal of the vital force—is more, and this opportunity, as may be seen by the hours required for study, is exactly what our girls have not. The Persians in training their athletes observed this principle. All the exercise they allowed was a moderate walk daily, and even this was stopped for several days before the contest; and while they did not equal the Greeks in mere strength, they excelled in activity and energy.

This is no light matter. If the figures of Prof. Magee are true—and there is no reason to doubt them—it is appalling! Something should be done, and done soon. If this cramming method is destroying our girls at this rate, it should be stopped at once. Nine or ten hours' study a day is more than any one can do to advantage; but even if it were necessary in order to cover the course laid out in the high schools, this would be no excuse.

No amount of culture can repay for a curved spine; no learning compensate for shattered nerves and ruined health.

RELATIVE STRENGTH OF MEN AND WOMEN. By means of a specially devised instrument, a French scientist has carried out some experiments for determining how the average strength of the two sexes compares, says the *Herald of Health*. The palm of the hand is placed on the instrument, and then the greatest downward pressure which the individual can give is exercised upon it, and the force thus produced is recorded by the usual clockwork device. Fifty robust men, and the same number of healthy women, both belonging to the middle class of society, with ages varying from 25 to 45 years, were tested in this way by the Paris scientist. The strongest man of the company was able to produce with his right hand a pressure equivalent to 85 kilograms (a kilogram is rather more than 2½ pounds) and the weakest to 40 kilograms, the average being 56 kilograms. One curious result was arrived at: The short men were all very nearly as strong as the tall men, the average difference between equal groups of two sizes being only three kilograms. The force of the strongest women of the 50 who were selected amounted to only 44 kilograms, and that of the weakest to 16 kilograms, while the average was 33 kilograms.

HEALTH OF THE STATE.—The report of the State Board of Health for October gives mortality reports from 71 cities and towns, having an aggregate population of 700,563. The fatalities during the month were 1077, at the rate of 18.36 per thousand per annum. Consumption was the cause of 153 deaths; acute pneumonia, 67; heart disease, 67; diphtheria, 46; cancer, 40; various diseases of the bowels, 109; all other diseases, 590.

TEA is said to have no ill effect upon the nerves if it is taken weak and cold. To prepare your cup of tea so that it will meet with the doctor's approbation, pour it into your saucer and add a little cool water. The very thought makes you shiver, but it is a good thing to do just the same.

ESSENCE of cinnamon, used as a spray, is found to be very useful in driving out malaria from hospitals and sick rooms.

USEFUL INFORMATION.

MOLASSES AS FUEL.—The Louisiana crop of molasses is about 450,000 barrels annually, and will be a constantly increasing quantity; a larger part of it is of superior quality, which finds a ready market, and the lower grades are constantly increasing; for these lower grades there is now scarcely any market, and their value has fallen so low that the question of the fuel value of such goods has arisen; the lower grades will increase in quantity comparatively, as the more thorough the manufacture of sugar is, the lower the grade of the resulting molasses. Its present market value leaves its value on the plantation at about \$3.33 per ton, which price per ton is about the present value of coal in the East. If it could be demonstrated that such molasses has a fuel value equal to or about to coal, priced for pound, it would quickly solve the problem which is now exciting much attention in Louisiana. The distillation of molasses into alcohol may be a more profitable method for its disposition, but as no experiments have been made in that direction, the sugar producers are in the dark about the matter. Experiments are desired as to the practical and comparative value of molasses for distillate or fuel. It may be asked in this connection what use is being made in this State and elsewhere of the residuum from beet-sugar manufacture.

HORSE-POWER OF WHALES.—Sir Wm. Turner, the present eminent professor of anatomy in the University of Edinburgh, Scotland, has given much attention to the study of whales, their structures, habits, etc. He estimates that the great Greenland whale (average length 50 feet) attains a maximum speed while swimming of ten miles an hour; the "Finer" whale (maximum length 85 feet) often making 12 to 14 miles an hour. Mr. Turner, in one of his lectures, said that he and John Henderson of Glasgow, the well-known builder of the Anchor line steamships, had spent much time in trying to arrive at a satisfactory conclusion as to the horse-power exerted by large species of the whale in making a speed of 12 miles per hour. As a base for their conclusions, they took the size and dimensions of the great "Finer," which was stranded on the shore at Longdridge some years ago. It was 80 feet long, weighed 74 tons, and had a tail which was 20 feet across at the extreme end of its flanges. With these data, Messrs. Turner and Henderson calculated that a whale of the dimensions mentioned, in order to attain a speed of 12 miles an hour, must exercise a propelling force of 145 horse-power.

CHARCOAL IN FILTERS.—Charcoal in filters has been much recommended for its remarkable power for absorbing organic matter. This property renders charcoal, however, whether vegetable or animal, but especially the latter, the most dangerous of all materials for continued use. It becomes saturated with organisms and the matter which they feed upon. It cannot be cleaned except by being subjected to a red heat, which cannot be done in an open atmosphere, and to do it in retorts would be quite too expensive. If used at all, it should be changed every day—an impracticable thing to do. If used for any great length of time, it would be about as bad as a dead cat in a filter. Finely granulated coke with sand might be used instead of charcoal, as with care and patience, coke and sand might be washed quite clean; but it is almost impossible to remove any impurity from charcoal except by fire.

MECHANISM FOR PREVENTING OVERWINDING IN COLLIERIES.—Mons. Remaux, director-general of the Societe de Lyons, has invented an ingenious contrivance for the prevention of accidents in the collieries by overwinding. It is in use in the company's mines at Lens, in the department of Lille, France. The apparatus consists of an arrangement of valves, which come into play directly the cage reaches a certain point in the shaft, and, if the engine should at that moment not be under control, immediately apply a powerful air brake. This, however, allows the cage to proceed at a certain speed. But should another point in the shaft be passed and the engine be still out of control, the brake is increased in power, steam entirely shut off, and the cage brought to a standstill.

A SIMPLE RULE for determining the width and thickness of rubber belting required to transmit a certain power, may be found from the following formula: h. p. multiplied by 155 and divided by speed in feet per minute, will equal the cross sectional area of the belt in square inches; from this it is a very easy matter to ascertain the width and thickness.

FOR REMOVING OBSTRUCTIONS.—At the recent street-car convention, a Pittsburgh inventor showed an appliance he has for placing in front of cars for removing obstructions. It revolves upward from the track and the inventor claims it will bounce human beings with as much safety to themselves as the light touch of a policeman's club.

NEVER START A HORSE WITH A WHIP.—The horse is as susceptible to kind words and kind treatment as any animal, and his faithfulness in man's service deserves more kindness and care than he receives. A good and careful driver will never start a horse with a whip. Teach him to start with the word.

TABLE OF CONTENTS.

EDITORIALS.—The American Balance Slide Valve; The Pelton Water Wheel Hoist, 343. Passing Events; The Mining Congress; A Miner's Convention; Why Comstock Dividends are Few, 350. B. Timonium Rock; The Freezing Process in Shaft Sinking, 351.

ILLUSTRATIONS.—American Balance Valves for Locomotives; Pelton Water Wheel Hoist, 343. The Freezing Process in Shaft Sinking, 351.

CORRESPONDENCE.—Mexican Mining Customs, 344.

MISCELLANEOUS.—Finding of the Lost Ship's Mine; The Mini Congress, 344. A Prospector's Fate; Columbia River Scenery; Redding Bars; Gold Extracting Works; Water Rights, 345.

MECHANICAL PROGRESS.—The Training of Mechanics; Bridges of Railroad Iron; Iron Melted by Electricity; Wire Nails from Steel Plates; A House Made of Copper; A New Mode of Fashioning Coal-Dust Fuel; Curiosities of Iron Working; Hardening Tools; The Twisted Wire Nail; A Much Needed Invention, 348.

SCIENTIFIC PROGRESS.—Whence Comes Intuition? The Cause of Coking in Coal; What is Ammonia? Searching for a Secondary Satellite; Miscellaneous, 348.

ELECTRICITY.—Electricity Made Perfectly Safe; A Safety Wire for Motors; A New Electric Battery; The Metropolitan Electric Railway; Looking for Power; The Overhead System; The New Telephone Instrument; Miscellaneous, 349.

GOOD HEALTH.—School Study and Curved Spines; Relative Strength of Men and Women; Health of the State; Miscellaneous, 349.

USEFUL INFORMATION.—Molasses as Fuel; Horse-Power of Whales; Charcoal in Filters; Mechanism for Preventing Overwinding in Collieries; Miscellaneous, 349.

MINING SUMMARY.—From the Various Counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 346-347.

MINING STOCK MARKET.—also in the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 356.

MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke, etc., 356.

Passing Events.

The developments in the Hale & Norcross suit now on trial in this city, referred to more at length in another column, go far in proving what the MINING AND SCIENTIFIC PRESS has long maintained, viz., that the mill-owners on the Comstock get what profits should come to the mine-stockholders. A radical change must be made in the milling systems in vogue up there before confidence in the mines can be again restored.

The Supreme Court has rendered a decision that the law appropriating \$300,000 for the World's Fair is valid. The California Commission can now go ahead and make the necessary preparations to have this State suitably represented at Chicago.

Four of the hitherto mining companies of Santa Cruz and San Luis Obispo counties have formed a pool. This is not a paving, but a mining company. The mining of this product in this State has now attained large proportions and is constantly growing. Several new deposits have been opened this year.

Thanksgiving comes to us this year while we are enjoying warm and balmy air and sunny skies. From the other side of the continent come tales of violent storms. If for nothing else, we should all be thankful for the climatic conditions which surround us.

A LONG TUNNEL JOB.—The Marysville Appeal of the 21st says: C. C. Butler of Steep Canyon, who resides between Smartsville and Spenceville, has sold his quartz mine to an

English syndicate, represented by Mr. Higginbottom, for \$31,000. He worked in the tunnel alone for 13 years, and is now repaid for his patience and perseverance.

The Mining Congress.

Our esteemed contemporary, the Denver Republican, in its enthusiasm over the Mining Congress last week, and opening of the new Mining Stock Exchange building, heads its long article descriptive of the events with "Alone in Their Glory—The Only Mining Exchange Building and the First National Mining Congress," implying that Denver alone has these things. The congress is conceded; but as to a Mining Stock Exchange building San Francisco has had one for 15 years past, built especially for a Mining Stock Exchange, to which purpose it is still devoted. It is a fine granite building, elegantly appointed, and cost, with its lot, \$700,000. The main room, one of the finest in the city, is devoted entirely to the business of the mining stock brokers, and the offices are rented to the brokers and mining companies.

On pages 344-345 of this number of the PRESS will be found an abstract of the proceedings of the Mining Congress at Denver. The Colorado papers which have come to hand contain detailed accounts of the procession, speeches, etc., which show that a great deal of enthusiasm was displayed and much interest was manifested in the proceedings. California was honored by the chairmanship in the person of Ex-Chief Justice Niles Searles. Miners from all over Colorado walked in procession in company with mine-owners and mine-brokers, with hands, floats, etc., all representative of the mining industry. The floats were mainly in the line of mining machinery of all descriptions. The procession was nearly a mile long.

The Inter-State drilling contest was the feature of greatest interest to the working miners. There were 23 teams entered for the double-handed contest, nearly all from Colorado camps. One team from Butte, Montana, carried off the prize. The men's names were Page and Reagan. There were 23 teams in the single-handed contest. In the double-handed contest the Butte boys were received with hearty cheers when they mounted the platform and got ready for the fray. They did not look like hinky fellows, but when the gong sounded for the start they proved their abilities as hammermen. Their work in changing, elicited wild shouts of admiration and approval from the thousands of miners present. Each handled the hammer for a minute and then changed to turning the drill and only lost two strokes during the entire 15 minutes. They put down a hole 29 15-16 inches in the allotted time and the audience went wild when the result was announced.

The rock selected was Gunnison gray granite, which is being used in the capitol building, and is counted the hardest obtainable in the State. A solid platform of inch planks was built in the center of the hall, and upon this two huge blocks of the stone were placed—one at each corner. The single-handed drillers had rocks on a lower platform.

In the single-handed contest; D. L. Jones of Clear Creek drilled 18 11-16 inches, the next man getting only 13 1/2 inches in the same time. Full details of the finish of the contest are not yet at hand.

The proceedings of the Congress were mainly confined to the silver issue, and the speeches were all in that direction. Among those who addressed the Congress were Senator Stewart, H. A. W. Tabor and Governor Rontt. Senator Stewart's speech was especially appreciated. Aside from the silver question, the most important subject considered was the Alien Act as it applies to mines and mines on railroad grants. The resolutions on these subjects are timely, and should aid the mining industry as bringing them forcibly to the attention of Congress.

Committees were appointed for the purpose of calling future mining conventions, and it was voted that the next one should be held at Butte, Montana. The Congress was harmonious in its deliberations, and there was much confidence felt that its proceedings will be conducive of benefit to the mining interest.

The unique, new building of the Colorado Mining Stock Exchange was dedicated with due ceremony to the mining interests of the State of Colorado.

Why Comstock Dividends are Few.

The trial of the suit of M. W. Fox against the directors of Hale and Norcross mining company, in which conspiracy to defraud the stockholders of the company is charged, is developing facts that fully substantiate the position of the MINING AND SCIENTIFIC PRESS, that many of the mines on the Comstock are run through the dummy director system in the interest of one or more mill rings.

Five of the directors' testimony shows they only owned from five to ten shares of stock, and had been made directors by others, but for what purpose outside of drawing their pay for attendance at each meeting of the directors, they professed profound ignorance. In their testimony they admitted to a lack of knowledge as to how the mine was run and how the ore was milled, and also that there were no safeguards or checks in the interest of shareholders against any fraud, if desired, in milling the ore. Their knowledge of the work in the mine and ore milled, cost, assays, etc., was confined entirely to the reports of the superintendent of the mine.

The testimony of Alvinza Hayward, one of the owners in the Nevada Mill and Mining Co., showed that the company had never paid any dividends and that there was in his possession \$60,000 of undistributed profits. He also testified to no knowledge of three outside pans that, it is claimed, are run on Hale and Norcross tailings and slimes. The mills were run by Capt. Overton, and he thought were in safe hands. W. S. Hohart's testimony was of similar character to that of Alvinza Hayward.

The third day of the trial more interest developed in the suit, as was evidenced by a largely increased attendance of attorneys, mill and mining men. The most important testimony brought out was that of Evan Williams, superintendent of the Nevada Mill & Mining Co. According to the Examiner's published proceedings of the case, Mr. Williams explained the process of handling the bullion after it was extracted from the ore. Under the regulations of the Carson Mint not more than 10,000 ounces could be deposited on any one day in the name of any one person. Frequently bullion was deposited in the name of Giverich & Bryson, saloon-keepers of Carson, and more frequently in the names of Messrs. Peters and Brown, two young clerks of the Bullion Exchange bank, of which the witness was vice-president. All the depositing was done by the witness. He stated he took a wagon, drove to the Carson Mint and deposited it in the names of several parties on account of Hale & Norcross. In a long series of questions as to why assays the information was elicited that the mine had no representative at the mill, that the tank-shovelers took the assays, and they were merely laborers at \$3 per day.

Then Mr. Williams testified that there were in the mill three slow-motion pans, which are located in a little building, added to the main building after it was built. The pans are run for the benefit of the mill company, and hold about a ton and a half to the charge, and work three charges each per diem, equivalent to 13 1/2 tons a day. The proceeds of the pans are turned over to the mill company. Mr. Williams said: "I take the bullion and weigh it. The foreman of the mill keeps the account, but I don't think keeps any books. He calls this the tallings bullion. At the Mexican mill we have two slow-motion pans worked on the same principle as at the Nevada—sulphurets and alimes together—and the proceeds of the bullion are turned over to the owners of the Mexican mill."

It was shown by Mr. Williams' testimony that no account of the output of the two mines was kept. The foreman had charge of the pans, and he sent the bullion to the James assay office at Gold Hill, where it was run into bars and shipped to the Mint at Carson, the Bullion and Exchange Bank in all cases handling the metal. The information was brought out that the cashier of the Bullion Bank is the chief clerk of the Carson Mint, and as the Superintendent is frequently absent, has full charge. The main part of Mr. Williams' examination was devoted to extracting a description of the interior of the Nevada mill and the three-pan annex into which the slime tanks lead. It was learned that there was a chute leading from the main building into the annex, with a little car-track on the side, in close con-

nection with the three-pan building, and that from the box into which the rich sediment which settled from the run-off slimes, it was a very easy matter for any employee to ladle out with a miner's dipper stuff worth \$30 a pound into the three pans, conducted as an adjunct to the mill company, for its exclusive profit, because presumed to be tailings.

During the examination, the plaintiff introduced in evidence a photograph representing a workman of the Nevada mill with a large dipper scooping out of the sand vat rich tailings from the Hale & Norcross ore, and then dropping them into the "hole in the mill," to be worked over for the benefit of the mill directors. The "man with the dipper" was identified by Mr. Williams as a workman in his employ at the mill, named Fillicon. The dipper itself was admitted to have been used in the manner and for the purpose stated.

The case is still on trial, and it is alleged that testimony of a far more damaging character will be brought out at an early day by the plaintiff.

A Miner's Convention.

Although the representatives of most of the other industries of this State meet from time to time to consider their joint interests, the miners of California have never banded together to consider the subjects affecting the industry to which they are devoted. Of late, however, they have made up their minds to be heard. The first steps were taken in Auburn, Placer Co., and a preliminary meeting was called on Wednesday of last week. The Placer Argus states that the meeting was called to order by Hon. J. A. Filcher, who read the responses which had been received to the circulars sent out. They were all of an encouraging nature, showing that the question of a miner's county convention for the near future met with a hearty approval. After the reading of these encouraging words, Mr. Filcher called for the nomination of a chairman for the evening, when Hon. J. H. N. F. was nominated and unanimously elected. Mr. N. F. made some stirring appropriate remarks, thanking the audience, and asked for the nomination of vice-president and secretaries. John Spaulding was chosen to fill the chair of vice-president, and Hon. J. A. Filcher and W. W. Rodchaver to perform the work of scribes. Interesting short addresses were made by Mr. Hartley, Dr. Schnabel, J. B. Hobson, Judge Hale, Mr. McHale, Judge Spear, Hon. W. D. Perkins, Justice Stevens, R. F. Burns and others, and throughout the meeting was one of thrilling interest.

A committee, composed of J. B. Hobson, Justice Stevens, Dr. Schnabel and the Secretaries, were appointed to draft a preamble and resolutions to be embodied in a call for a Miners' County Convention, to be held in Auburn at the earliest day practicable, and they reported the following, which was adopted:

Whereas, The history of California of late years has been a history of oppression to the mining industry, the people being educated through a portion of the press that mining is vandalism and that miners are vandals, and

Whereas, the courts have gone so far as to decide that mining cannot be pursued even where it does not result in injury to others, and

Whereas, The rulings of the Land Offices have rendered it almost impossible to secure further patent to mining claims, and tend to the withdrawal of the mineral lands of the State from location and exploration, and

Whereas, A corps of competent Government engineers, after a careful examination of the situation, have reported that it is practicable to construct works that will enable mining to be continued without injury to other industries, and

Whereas, By a complete restoration of the mining industry in California, the gold output of the State and the revenue of the country would be increased from ten to twelve millions a year, according to the length of the rainy season, and

Whereas, In the face of these facts, the miners, long suffering and slow to anger, have remained inactive, believing in the justice of their cause and trusting that the Government would see their wrongs and right them, and

Whereas, Instead of remedial measures being proposed, they see and feel the bands tightening around them, and

Whereas, They are convinced that further indifference to these growing evils means the complete ruin of the miners as individuals and death to the mining industry; therefore be it

Resolved, That in view of these facts, the time is overdue for the miners and all others interested in the mining industry to rise and assert their rights and organize in defense of their interests and their homes. To start the ball rolling in the direction of organization, it is further

Resolved, That a Miners' Convention be, and the same is hereby called, to meet in Auburn on Saturday, Nov. 28th, at 1 o'clock P. M., for the purpose of further considering the evils that are hampering the mining industry and preparing the way for a Miners' State Convention with the view of concentrating our voice as to make it heard in the halls of legislation, the departments of the Government and the courts of justice.

Resolved, That the miners of Placer county and all other interested in mining, are hereby called upon to take hold of this move energetically and exert themselves each and all, to one waiting for another to see that their several localities are fully represented in said Convention.

Resolved, That the representation in said Convention be limited to five delegates from each voting precinct in

Placer county, and to such mining men from other counties as may favor the Convention with their presence.

Resolved, That each precinct in Placer county be and is hereby urgently requested to send to said County Convention the full representation to which it is entitled.

Resolved, That these resolutions be published in the papers of Placer county, and that all other papers in the State friendly to the mining industry be requested to publish the same.

J. H. NEFF, Pres.
JOHN SPAULDING, V. P.

J. A. FILCHER,
W. W. ROBBINER,
Secretaries.

At the close of the meeting the Auburn people present met and elected delegates to the said Miners' Convention as follows: Precinct 1, Gen. Jo Hamilton, J. A. Filcher, D. W. Spear, P. McHale and B. F. Hartley. Precinct 2, John Spaulding, J. B. Patterson, J. B. Hobson, E. C. Uren and T. B. Everett.

The principal idea of this county convention is to formulate a plan for a State convention, mainly for the purpose of organizing a miners' association and memorializing Congress as to needed legislation for the mining industry of California. In all probability, should a State convention be called, it will be held in San Francisco, the most suitable place for it. The miners of this State have many grievances to which public attention should be called, but nothing can be accomplished by desultory action. United effort will do a great deal if properly directed. We hope to see the State convention called.

The Freezing Process in Shaft-Sinking.

The difficulties connected with sinking shafts when large bodies of quicksand and drift are met with, have to be occasionally, encountered and overcome, in many localities. The Petsch "freezing process" is intended to overcome these difficulties. It was first applied in this country at the Chapin mine, Michigan, and the *Engineering News* describes the system adopted there. The engraving quite clearly shows the application.

The owners of the American patents, the Petsch-Scoy Smith Freezing Co., contracted to freeze, excavate, and open up a rectangular shaft $15\frac{1}{2} \times 16\frac{1}{2}$ feet, and about 100 feet deep to the ledge. The mining company put the freezing pipes into the ground 3 feet apart, in a circle 29 feet in diameter, and, with the exception of two of the pipes, to the ledge. This proved to be a difficult task, on account of the many boulders encountered. A 10-inch casing pipe with flange joints was first drilled down by various means, a drill being worked within the pipe when necessary, and the material removed by jetting or by a sand pump. The casing pipe being once down to the ledge, a freezing pipe was placed inside, and the outer casing pipe drawn up and used for the next pipe. The freezing pipes left in the ground were 8 inches in diameter, the lower ends being closed.

Inside of these 8-inch pipes were placed pipes $1\frac{1}{4}$ inches in diameter, open at the bottom. These inner pipes, as well as the outer pipes, were connected together at the top of the ground, as shown in the illustration, forming a complete circuit, through which a cold brine was circulated.

The brine used was a solution containing about 25 per cent. of calcium chloride, which has a very low freezing point. The brine was cooled with a Linde ice machine, made by F. W. Wolf, of Chicago, having a refrigerating capacity of 50 tons of ice per day. The ammonia was compressed to about 135 lbs. per square inch, and cooled by passing through coils immersed in water kept cold by pumping from a brook. Then the ammonia was allowed to expand through coils immersed in the brine, and finally returned to the compressor.

The temperature of the expended ammonia was such as to cool the brine to a few degrees below zero Fahrenheit. This brine being circulated through the ground pipes, was raised in temperature about 2 deg. Fahr. After 40 days' freezing, an ice wall 10 feet thick was formed around the shaft. The excavation—commenced soon after starting the ice machine—had in the meantime reached a depth of 40 feet. Thirty days more sufficed to reach the ledge.

The shaft was for convenience, curved as the excavation proceeded. This was, however, not necessary, as the walls would have stood vertically throughout the whole depth very well. The temperature of the air within the shaft was generally below the freezing point, and there was no indication of the exposed material thawing. The curbing was made of horizontal

sets of timbers, 16 inches square, placed two feet apart, with 4-inch vertical plank behind the timbers. The cross walls were placed in afterward.

The timbering was supported from one set to another by bolts placed near the corners of the shaft, the whole system being suspended from cross timbers at the surface of the ground. The unfrozen area within the shaft grew less as the actual running time of the freezing machine increased. When a stratum of boulders was encountered, the frozen area reached nearly across the shaft; but when quicksand containing a large percentage of water was passed through, the unfrozen area was greater. The reason of this is readily understood when it is remembered that the specific heat of water is about five times as great as that of any of the other materials, and, therefore, the strata containing most water would require more cold and would be longer in freezing.

The frozen quicksand resembled sandstone. The corners of broken pieces were hard and sharp. Granite boulders embedded in it showed a decided tendency to fracture across rather than break loose. The tensile strength of the frozen ground, as determined by a cement testing machine, was equal to that of the best neat Portland cement, and varied from 350 to 450 lbs. per square inch; and its strength

against crushing, as determined from inch square cubes, was 850 lbs. per square inch.

This furnishes data from which the strength of the surrounding frozen wall may be computed as an arch. An ice wall ten feet thick will be found sufficiently strong for any case likely to occur. Near the bottom the freezing extended within the circle solidly to the center. It is not known how far it extended outside, as no borings could be made through it. A test pit was sunk outside the shaft as far as the water would permit (some 22 feet), and from this it appeared that the freezing extended outwardly from the pipes at that point about 13 feet.

The material was mostly loosened by picks and chisel bars. Black powder was used for blasting for a considerable time, but this was discontinued for fear the concussion might injure the pipes or fracture the wall. The material was hoisted out by an iron bucket, which also took out the water which stood in the unfrozen center. There was no appreciable inflow of water until the excavation had reached nearly to the ledge.

On reaching the ledge it was discovered that it was so fissured and disintegrated as to allow water to come in under the frozen wall, at a corner in the vicinity of one of the pipes that did not extend to the ledge. On 20th Febru-

ary, the incoming stream had so worn a channel as to permit a jet of sand and water three inches in diameter to enter.

The shaft was allowed to flood, water being pumped into it at the same time, to prevent as much as possible the flow of water through the opening.

An eight-inch freezing pipe was put in place in the shaft, the foot being directly at the opening, the purpose being to freeze the leak off.

Cold brine was circulated through the whole system of freezing pipes for ten days uninterrupted, when the water was pumped out, and the seam was found to be quite closed; but there was still a small amount of percolation through the ledge, requiring occasional pumping to clear the shaft; ice had collected several inches thick on the side of the shaft and several feet in the corner, where the extra freezing pipe was placed.

The work of removing the sand which had come in with the water and the clearing up of the bottom continued for two weeks, when the water from the ledge increased at such a rate that it was decided to lay short auxiliary freezing pipes against the leaks and freeze the ledge itself. This was done, the shaft was flooded again, and the brine was circulated 30 days. When the water was pumped out, the leakage was found to be small and the excavation was proceeded with. The soft, shaly rock was removed until a hard bearing was obtained for the timbers, and the timbering was completed from the surface of the ground to the excavated depth.

Water is the engineers' most troublesome enemy, and the conversion of this subtle foe into a barrier of defense is a triumph of engineering as effective as it is novel. This process can be applied to excavations for bridge piers, to tunnels, and to other general work of a difficult and expensive character, as well as to shafts. But in shaft work alone it should be invaluable, as by it numerous valuable deposits of coal and other minerals, now inaccessible on account of overlying strata of water-bearing materials, can be reached, as in the case of the Chapin mines, and in those Belgian coal mines which first led Mr. Petsch to launch upon the engineering world his startling but very efficient process.

Now for the World's Fair.

In Sacramento on Tuesday afternoon, the Supreme Court rendered a decision declaring the Act appropriating \$300,000 for the World's Fair constitutional, consequently this money will now become available for the purpose of making a California display at the Columbian Exposition. The bill making the appropriation provided for the appointment by the Governor of one Commissioner from each Congressional district, making a Board of seven Commissioners, and the following were selected: Irving M. Scott and James D. Phelan of San Francisco; L. J. Rose of Los Angeles; Thomas H. Thompson of Tulare; Robert McMurray of North San Juan, Nevada Co.; A. T. Hatch of Solano Co.; and John Daggett of Shasta Co. The Board organized by the election of Irving M. Scott, Pres.; James D. Phelan, Vice-Pres., and Thomas H. Thompson, Sec'y. Offices were at once secured at 59 Flood Building of this city, and active operations were commenced at once, but were arrested by the refusal of the Comptroller to audit the bills until the Supreme Court passed upon the constitutionality of the appropriation. This has now been done, and the funds are available.

There has been some doubt as to the wisdom of making such a large appropriation as \$300,000 for this purpose, but it is too late to urge that view now. The money will be spent, and the public duty now is to rally to the support of the Commissioners and to cooperate with them, to the end that the money shall be wisely and economically expended for the advantage of the whole State. There will no doubt be great pressure exerted by a throng of visionaries and swells to expend the money upon all kinds of frills and wild-cat schemes beneath the dignity of the State, and not calculated to advance her interests. To successfully meet these, there must be the pressure of better kinds, consequently we urge upon all legitimate interests of California to give due attention to the matter and prepare to act intelligently. We believe the Commission desires to make the very best possible use of the money entrusted to it, and it should feel that the people expect this and will earnestly support and advance its efforts in this direction.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

STAMP SHOES.
STAMP DIES.

Adamantine Shoes and Dies

—AND—
CHROME CAST STEEL
Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

THESE CASTINGS ARE EXTENSIVELY USED IN ALL THE MINING STATES and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to above conditions. When ordering send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.
H. D. MORRIS, Agent, 220 Fremont St., San Francisco.
Special attention given to the purchase of Mine and Mill Supplies.

ELECTRIC BLASTING.

VICTOR ELECTRIC FUSE

VICTOR ELECTRIC PLATINUM FUSES.
Superior to all others for exploding any make of dynamite or blasting powder. Each fuse folded separately and packed in neat paper boxes of 50 each. All tested and warranted. Single and double strength, with any length of wire.

VICTOR BLASTING MACHINE.—Made in two sizes. No. 2 fires 20 to 30 holes. No. 1 fires 5 to 8 holes. Adapted for prospecting, stump blasting, quarry and general railroad work.

"PULL UP" BLASTING MACHINE.—The strongest and most powerful machine ever made for Electric Blasting. No. 4 size fires 70 holes. No. 3 size fires 40 holes. Are especially adapted for submarine blasting and large mining work.

Standard Electric Fuse and Blast Tester, Wire Reels, new design, Lending and Connecting Wire.

—MANUFACTURED ONLY BY—

JAMES MACBETH & COMPANY,

128 Maiden Lane, New York City.

PARKE & LACY CO., San Francisco, Cal., AGENTS.

SQUARE FLAX PACKING.

MANUFACTURED FROM STRICTLY FIRST-CLASS FLAX AND PURE LUBRICANTS. HAS NO SUPERIOR for all Hydraulic Work. CALICO WATER WORKS CO., CALICO, CAL., Dec. 16, 1890.

W. T. Y. SCHENCK—Dear Sir: We find your "Red-Cord" Square Flax Packing the "Boss." Yours truly
J. R. LANE, Secretary.

The red cord runs the entire length. Put up in boxes of 20 feet, or coils of 60 to 80 lbs. For sale by all dealers. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.

Bituminous Rock.

Four bituminous rock mines, which furnish material for street paving, are now owned by one company, a consolidation having been effected. Two of these mines are in Santa Cruz county. One is the Walrath, formerly owned principally by ex-Senator Walrath, and the other is the Thirber, whence the Pacific Paving Co. obtained a part of its supply of bitumen. These mines are the same deposit, the two quarries being separated by a fence.

The other two quarries are in San Luis Obispo county. One, the Adams or Fairchild quarry, was the source of supply of the Southern California Bituminous Co., and the other, the Neuvel, was mined by the Pacific Paving Co.

The company formed to operate these mines is called the Bitumen Consolidated Mining Co., and the stockholders are interested in three large paving companies, the Santa Cruz Rock Paving Co., of which A. Walrath is president and Geo. M. Perine is manager; the Pacific Paving Co., of which A. C. Bassett is president and J. H. Swift is vice-president, and the Southern California Bituminous Co., of which J. A. Fairchild is president.

The officers of the new consolidated company are A. Walrath, President; A. C. Bassett, Secretary, and J. A. Fairchild, Manager.

Secretary Bassett was for many years Superintendent of the Coast Division of the Southern Pacific Company.

The consolidated company will not engage in the business of paving. The paving companies will remain in business as before the consolidation was made. The only business of the consolidated company will be to mine the bituminous rock and sell it to paving companies.

Mr. Bassett said also that increase of the price of the bitumen pavements is not contemplated. The intention is, however, to concentrate the mining business at one place, and hence, either the Santa Cruz quarries or the San Luis Obispo quarries will be closed.

The quarries that will be operated will be the ones whence the rock can be most economically obtained, the quality being exactly the same. At present the cost of shipment from the San Luis Obispo quarries is less than from the Santa Cruz quarries, though the distance is four times as great.

The San Luis quarries are on the line of the narrow gauge road, that has an ocean outlet at Port Harford. At Santa Cruz, they have to haul quite a distance in wagons.

The Ventura and Santa Barbara deposits are not in the pool. The rock or asphaltum from the two latter counties is superior in quality, by reason of the percentage of fixed bitumen, to those of Santa Cruz or San Luis. The big deposit at Ventura is not now being worked. The two deposits some seven miles north of Santa Barbara produce the best yet turned out in this State and are being actively worked. The immense deposits of Kern county have shipped some asphaltum this year, but are not yet properly opened. When they are, they may be able to give a cheaper product than many of the mines of the coast counties. It is all a question of freight with these deposits, one costing about as much as another to work at the mine itself. This industry is a rapidly growing and prosperous one.

MINING TIMBERS.—When we contemplate the thousands upon thousands of mining timbers that are annually hauled down from the mountains and used in our mines, we are forced to the conclusion that some day the demand will exhaust the supply. Only a few years ago our mining timbers were obtained only eight or ten miles above the mining belt; but now they are brought 25 or 30 miles, and even at that distance there is a struggle among contractors to see who can get those which may be arrived at with the least inconvenience. At the same rate our timbers have been used during the past ten years, it is safe to say that within the next ten years timbers for this mining section will have to be hauled 40 miles, unless the supply can be brought from other sections than the mountains east and adjoining us. This will render mining so expensive that our low-grade mines will have to be abandoned before they are worked out, unless they can be operated with fewer timbers, or the mode of transportation be changed beyond the use of mule teams. It is about time for some active mind to begin think up some mode by which our miners can be supplied with timbers after the next few years.—*Amador Dispatch.*

Placer Claims.

Their Titles Threatened by Recent Rulings.

The recent rulings of the Land Department in contests arising between agricultural and mining claimants are fraught with danger to the mining industry, says the *Nevada Transcript*. The Department, both in the local and general Land Offices, announces the rule in such contests to be that the miner must show that the lands he is claiming possessed a known, present, actual value for mining purposes; that is, that mere speculative value will not defeat the claim of the agriculturist, and unless the miner can show that his land contains gravel or other deposits from which there has been extracted, or is being extracted, gold in paying quantities, its mineral character is not established.

It must be apparent to all that under such a rule the holders of undeveloped placer claims are placed at a very great disadvantage.

In portions of Nevada county, as well as in Placer, Sierra, El Dorado and other mining counties, many claims which are at present undeveloped are being held by miners.

Not a few of these claims are known to be underlaid by old river channels, in the effort to develop which many years of labor and thousands of dollars have been expended, yet the owners have been unable to demonstrate that they possessed a "known present value" for mining purposes.

It is commonly known in the mining sections that the expenditure of years of labor and thousands of dollars frequently fail in proving the real value of the ground, so far as determining it by actual results is concerned, while at the same time the claim, when opened, may prove extremely rich. Numerous examples exist where miners have spent a lifetime in a vain effort to develop a given gravel claim, yet when they have finally abandoned the undertaking as hopeless, some other party or company has come along and in a short time accomplished what its predecessors were utterly unable to.

Under these conditions, it is plain that until more favorable legislation can be had it is advisable that parties holding claims of this character at once proceed to take the necessary steps to obtain a Government title.

Under the law as it now exists, the miner can take preliminary steps in this direction without being obliged to pay for the land at the time of his application. After having made the application and proofs, he may delay payment for an almost indefinite period, and still be protected as against the claims of others.

In a recent case from this township, it was held by the Sacramento Land Office that the mineral claimant having failed to prove "that the land in controversy possessed a known, present, actual value for mining purposes, could not recover."

It frequently occurs that the surface of placer mining claims is also valuable for agricultural purposes, and especially where the lands can be irrigated; hence it follows that the agriculturist has little or no difficulty in proving the agricultural value of the land, while the miner is at the disadvantage of being compelled to prove that the land contains mineral in paying quantities; or, in the event it is believed there exists an old river channel beneath the surface, of proving that such channel contains gold in paying quantities. In such a contest, with the miner laboring under such disadvantages, it is but little wonder that in the end he finds the claim upon which he has perhaps spent the best years of his life and all his hard-earned savings awarded to the agriculturist.

A CELEBRATED CASE.—United States Circuit Judge Pardee, at San Antonio, Texas, has rendered a decision in the celebrated ore seizure case, recently reviewed by him in an appeal taken by the Secretary of the Treasury from the United States Board of Federal Appeals of New York City. By to-day's decision the action of that board was reversed, and the case will now be tried on its merits in the Federal Court here. The case involves the whole mining industry of Mexico and the result is awaited with much interest.

RECENT EXPERIMENTS in England have shown that an electric light, when turned vertically toward the sky gives most extraordinary results. For instance, the light of the Eddystone light-house can be seen only 17½ miles on a clear night, but a vertical beam of light of far less power is visible just twice as far, with a strong chance of its surmounting an ordinary fog. This discovery will probably bring about a decided change in the manner of placing the electric light in light houses.

Successful Patent Solicitors.

As Dewey & Co. have been in the patent soliciting business on this Coast now for so many years, the firm's name is a well-known one. Another reason for its popularity is that a great proportion of the Pacific Coast patents issued by the Government have been procured through their agency. They are, therefore, well and thoroughly posted on the needs of the progressive industrial classes of this Coast. They are the best posted firm on what has been done in all branches of industry, and are able to judge of what is new and patentable. In this they have a great advantage, which is of practical dollar and cent value to their clients. That this is understood and appreciated, is evidenced by the number of patents issued through their *SCIENTIFIC PRESS* Patent Agency (S. F.) from week to week and year to year.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING NOV. 17, 1891.

- 453,435.—GAS ENGINE—Barrett & Daley, S. F.
453,436.—VALVE GOVERNOR FOR GAS ENGINES—Barrett & Daley, S. F.
453,476.—BUCKLE FASTENER—F. A. Blackburn, Bisbee, A. T.
453,440.—BIT STOCK—W. Cameron, Milpitas, Cal.
453,272.—HUB AND AXLE—W. W. Flewelling, Kingsburg, Cal.
453,354.—CULTIVATOR AND WEED CUTTER—E. S. Gerow, Lafayette, Cal.
453,578.—WASH BOILER—E. W. Giddings, S. F.
453,353.—DOCK SCRAPER—John Hackett, Oakland, Cal.
453,354.—SACK HOLOER—W. F. Jeans, Woodland, Cal.
453,355.—WAGON JACK—W. Leavewood, Sacramento, Cal.
453,524.—DEVICE FOR TAPPING MAINS—M. P. Madden, Coronado, Cal.
453,367.—FUMIGATOR—W. Martin, Glenwood, Cal.
453,453.—MAIL WAGON—R. R. Richardson, Portland, Or.
453,178.—FRUIT GATHERER—R. B. Vanderburg, Long Beach, Cal.
453,258.—RAILWAY RAIL-JOINT COUPLING—Geo. Weeks, East Oakland, Cal.
453,239.—PICK—Wm. Wilson, Pine Grove, Nev.

The following brief list by telegraph, for Nov. 17, will appear more complete on receipt of mail advices:

- Frank H. Fischer, Oakland Cal., water tank; Carroll E. Oate, Oakland, basket; Albert M. Grubbs, Forest Grove, Oregon, railway switch and railway frog; William Jones, La Grange, Oregon, feeders for heaters; R. A. McVitt, Snohomish, Wash., tool for miners' blast-ers' use; Dr. F. Oliver, Oakland, assignor to Truman, Hooker & Co., San Francisco, dirt scraper; Caleb B. Page, Tacoma, Wash., dumping car; John E. Read, Los Angeles, agricultural machine; John G. Rollins, Forest, Cal., building material; Adolph Summer, Berkeley, Cal., removing free hydrochloric acid from sulphochlorides; Hawden Swain, San Francisco, printing press; George Y. S. Wade, San Francisco, figure toy.

NOTE.—Topics of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DOCK-SCRAPER.—John Hackett, Oakland, No. 453,353. Dated Nov. 17, 1891. This is an implement specially useful for clearing out the mud, which accumulates beneath hydraulic lift docks and other confined spaces of similar nature. In hydraulic docks the foundation is sufficiently low to admit of a platform, which is lowered so that the vessel can be floated into the dock above it and upon which the vessel is afterward lifted out of the water. This space above the bed or foundation timbers of the dock is liable to become filled with mud and other substances, so as to render it in time impossible to lower the platform as much as is necessary to admit larger vessels. The contracted space, which is also a considerable distance below low-water mark, makes it almost impossible to clean this mud out and keep the dock free from it. Capt. Hackett designed this machine, which he has successfully used at the hydraulic dock of the Union Iron Works in effectually and rapidly clearing out the mud under the dock. It consists of a scraper with a means for reciprocating it beneath the platform of the dock, and a gate or door, which is held open while the scraper is passing to the inner end, but which is closed, so that when the scraper is again drawn out it brings a load of mud with it. The hydraulic dock at the Union Iron Works covers a space of 450 feet long by 65 feet wide, but the work was carried on and the dock entirely cleared of mud without in any way interfering with its operation and without interruption of the cleaning operation, except at times when vessels were being taken on or left off from the dock.

SACK-HOLOER.—Wm. F. Jeans, Woodland, Volo Co. No. 453,354. Dated Nov. 17, 1891. This is a novel device for holding sacks so that they may be filled with grain or other material. It consists essentially of a means for clamping the mouth of the sack upon a holder by which it is held open and then released from the holder. By the construction adopted for the holder, the entire circumference of the top of the bag is gripped by the clamp, and the bag is thus held up clear from the floor beneath. No undue strain is brought upon any one part of the bag, and it is allowed to stretch so that the corners and all parts will be well filled.

CULTIVATOR AND WEED-CUTTER.—Edward S. Gerow, Lafayette, Contra Costa Co., assignor of one-half to C. L. Maxwell, Oakland, No. 453,352. Dated Nov. 17, 1891. This apparatus is designed especially to eradicate weeds and loosen up and cultivate the ground, and it consists of a framework loosely pivoted together, so that the parts may be shifted with relation to each other similarly to those of a parallel ruler, and by this construction the cutting-blade or cultivator may be thrown to one side or the other of the main frame, so as to reach parts of the ground at a considerable distance therefrom.

WAGON-JACK.—Wm. Leavewood, Sacramento, No. 453,355. Dated Nov. 17, 1891. The object of this wagon-jack is to raise the whole vehicle from the ground, and it is especially useful in lively stables and blacksmith or paint shops where work is to be done upon the vehicle and it is desirable to raise it entirely from the ground. It consists of a base with a parallel frame and connecting bars or links, and a peculiarly constructed lever mechanism, whereby the upper movable part of the frame, when placed beneath the vehicle axle, may be moved about its supporting bars or links so as to raise it and the vehicle. A loaded vehicle may be raised by this apparatus.

Books on Assaying.

By C. H. AARON.

PART I.—Gold and Silver Ores.—Price \$1
SECOND EDITION.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes thereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of most wordsy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorching; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; Cupellation; Assay by Amalgamation; Finding the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations well bound in cloth; 1890. Price, \$1, postpaid. Sold by DEWEY & Co., Publishers, No. 220 Market street, San Francisco.

PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulations, etc.; Lead Ore; Copper; Zinc; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores by Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & Co., Publishers, No. 220 Market St., S. F.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

By P. M. RANOLLE.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulae, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is especially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated: General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulas Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulae and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water through Short Tubes and Compound Tubes; Flow of Water through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend-Circular and Angular; Flow through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Rules; Hints for Speedy and Approximate Estimates, etc.

Price, \$2.00, post-paid. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."

A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.

Price, \$3.00, post-paid. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco.

By J. S. PHILLIPS, M. E.

The work is divided into four parts—Rock, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulas as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By GUIDO KUSTEL, M. E. 1890.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed with facts. It gives short and concise descriptions of various processes an apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, cloth, postage free. Sold by DEWEY & Co., Publishers, 220 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 164 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & Co., S. F.

THE MANUFACTURE OF SOAP & CANDLES.

A New and Thoroughly Modern Book.
The Most Complete and Valuable in any Language.

A Practical Treatise on the Manufacture of Soap and Candles, based upon the Most Recent Experiences in the Science and the Practice; comprising the Chemistry, the Raw Materials, the Machinery and Utensils, and Various Processes of Manufacture, including a great variety of formulae. Edited chiefly from the German of Dr. G. Deiss, A. Engelhardt, Dr. C. Schaeffer and others. With additions and lists of American Patents relating to these subjects. By William T. Brant, Editor of "A Practical Treatise on Animal and Vegetable Fats and Oils," one of the Editors of "The Techno-Chemical Receipt Book." Illustrated by about 163 engravings. In one volume, 8vo., of over 677 pages.

Price \$7.50, by mail, free of postage to any address in the world.

An illustrated circular showing the contents and specimens of the engravings of this valuable book, eight pages, quarto, will be sent free to any one in any part of the world who will furnish us with his address.

ANIMAL, VEGETABLE AND MINERAL OILS.

A Practical Treatise on Animal and Vegetable Fats and Oils, as well as the Manufacture of Artificial Butter, Lubricants, including Mineral Lubricating Oils, etc., and on Ozokerite. By Wm T. Brant. Illustrated by 244 engravings. 739 pages, 8vo. Price \$7.50.

An illustrated circular of this book, 8 pages, 4to, will be sent free to any one furnishing his address.

A Practical Treatise on Petroleum. By Benjamin J. Crew. Illustrated by 70 engravings and two plates. 8vo. Price \$5.00.

An illustrated circular of this book, 4 pages, 4to, sent free.

The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

NEW AND VALUABLE BOOKS

— FOR —

METAL WORKERS.

LANGBEIN.—A Complete Treatise on the Electro-Deposition of Metals. Comprising Electro-Plating and Galvanoplastic Operations, the Deposition of Metals by the Contact and Immersion Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Descriptions of the Electric Elements, Dynamo-Electric Machines, Thermopiles, and of the Materials and Processes used in every Department of the Art. Translated from the German of Dr. George Langbein, with additions by William T. Brant, editor of the "Techno-Chemical Receipt Book." Illustrated by 125 engravings. In one volume, 8vo., 404 pages. Price \$4.00.

BLINN.—A Practical Workshop Companion for Tin, Sheet-Iron and Copper-Plate Workers. Containing rules for describing various kinds of Patterns used by Tin, Sheet-Iron and Copper-Plate Workers. Practical Geometry; Mensuration of Surfaces and Solids; Tables of the Weights and Strengths of Metals and other Materials; Tables of Areas and Circumferences of Circles; Composition of Metallic Alloys and Solders, with numerous valuable Receipts and Manipulations for every-day use in the workshop. By Leroy J. Blinn. A new, revised, and enlarged edition, printed from new type, and with 170 newly engraved illustrations. In one volume, 12mo., 296 pages. Price \$2.50.

BRANT.—The Metal Worker's Handy Book of Receipts and Processes—Being a Collection of Chemical Formulas and Practical Manipulations for the Working of all the Metals and Alloys, including the Decoration and Beautifying of articles manufactured therefrom, as well as their preservation. Edited from various sources by William T. Brant, editor of "The Techno-Chemical Receipt Book." Illustrated by 63 engravings. Over 600 pages, 12mo., cloth, gilt, closely printed, containing a vast amount of valuable matter on all the Metals and Alloys, not to be found in any other book in the English language. Price \$3.50.

BRANT.—The Metallic Alloys. A Practical Guide for the Manufacture of all kinds of Alloys, Amalgams, and Solders used by Metal Workers, together with their Chemical and Physical Properties, and their application in the Arts and Industries. Edited from various sources by William T. Brant, one of the editors of "The Techno-Chemical Receipt Book." etc. Illustrated by 16 engravings. 12mo., 428 pages. Price \$3.00.

The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

Circulars, giving the full Tables of Contents of all of the above books, will be sent free of postage to any one in any part of the world who will furnish his address.

Our New and Enlarged Catalogue of Practical and Scientific Books, 83 pages, 8vo., and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Nov. 25, 1891.

General trade for this time of the year continues fairly active. Railroad construction and other improvements are being vigorously pushed in all parts of the State, calling for large sums of money, which are disbursed as soon as received. The trade of the State are on a more substantial footing than for years past. The local money markets are active but fairly easy. Tax-paying ends for this year with this month, while the annual disbursements for interest, dividends, etc., in January next, are virtually provided for. Eastern mail advices point, with unerring certainty, to an extraordinary prosperous season. *Iron Age*, in its review, says that the State canals are announced to close Nov. 30, the eastward shipments from lake ports will soon close and throw a large traffic on the railroads, which in the West are already blockaded with traffic before the corn season is fairly opened. Railroad receipts for October show the heaviest gain since October, 1889, and this although the ore traffic was smaller than a year ago.

The preliminary Government statement of the exports for October makes it probable that the aggregate may exceed \$100,000,000 for the first time in the history of the country, and this despite a decrease in the value of cotton, provisions and oil, the gain being due to breadstuffs alone. Shipments were unusual both from New Orleans and the Pacific Coast.

MEXICAN DOLLARS.—The market continues dull at around 74 cts.

QUICKSILVER.—Receipts the past week aggregate 303 flasks. The demand continues fair, with quotations reported unchanged at pool rates given out about a fortnight ago.

SILVER.—The market has shown only slight fluctuations in quotations either at home or abroad. The situation, so far as we are able to learn, is virtually unchanged. It looks very much as if there will soon be a pronounced movement in the United States and in Europe to advance the market price, but this is hardly likely to set in until after Congress meets. The developments in the suit against the directors of Hale & Norcross Mining Co., are calculated to show the erroneous conclusions of many "gold bugs" that with silver remonetized the output of the Comstock mines will be largely increased, for according to the testimony adduced, it seems safe to say that over one-half of the bullion turned out was not made public and therefore there can not be any material increase in the output of the metal.

LIME.—Receipts the past week aggregate 3690. The exports to the Hawaiian Islands appear to be increasing. The demand in this State is quite free.

BORAX.—On Nov. 20 there was shipped by water to New York 1016 cts. The market is fairly steady at current quotations. On Nov. 24 the steamship Mineola for New York took out 3018 sks of borax and 1350 sks borates.

CHROME ORE.—Shipments to New York continue to be made at regular intervals. On Nov. 20 there was forwarded by sail vessels 1398 cts.

TIN.—The local market continues dull and lifeless. In plate, outward freights from England are advancing, which will have its influence on values for shipment. At New York concessions are being made on both pig and plate, but without leading to much business. London cables to *Iron Age* report the plate market quiet with no immediate improvement looked for.

LEAD.—The local market is reported slightly firmer at unchanged quotations. At the East the market is reported stronger under firm holding and a fair inquiry.

ANTIMONY.—The market is strong with an advance obtainable in sympathy with better prices at the East and in Europe.

IRON.—Imports the past week aggregate 528 tons from Liverpool. The spot market is firm. For shipment, higher outward freights cause higher asking prices.

COKE.—Imports the past week aggregate 1677 tons. The spot market is soft, but for shipment it is firm.

COPPER.—The market is essentially unchanged. The loss by fire of the Union mills at Copperopolis will curtail the output on this coast. New York mail advices report as follows: Consumers have purchased a number of small lots of Lake Superior ingot, for delivery during the balance of the year at 17 1/2 @ 17 3/4. The transactions reported involve a total of 500,000 to 600,000 pounds. No inclination to anticipate future wants is manifested, and the leading producers pretend to be indifferent, claiming that a large portion of the present and near future output is under the control of orders. The fact remains, however, that more than enough copper to go around comes out from some source or other, and the competition of the smaller companies and speculative holders is met even by the apparently strongest concerns when it comes to matters of actual business.

COAL.—Imports the past week aggregate as follows: Newcastle, N. S. W., 15,446 tons; Departure Bay, 7232; Liverpool, 3594; Glasgow, 1800; Swansea, 3510; Cardiff, 2490; Coos Bay, 1300; Seattle, 2653. Total, 38,025 tons. The spot market is more or less demoralized, owing to heavy arrivals and no yard room. Large dealers claim that the market will soon begin to steady itself, but we admit that the present outlook does not warrant any improvement for some time to come. For shipment higher prices are asked for Australian and English.

Eastern Metal Markets.

By Telegraph.

NEW YORK, November 25.—The following are the closing prices the past week:

	Silver	Copper	Lead	Tin
Thursday.....	94 1/2	11 1/2	4 3/4	19 85
Friday.....	94 1/2	11 1/2	4 3/4	20 10
Saturday.....	94 1/2	11 1/2	4 3/4	20 10
Sunday.....	94 1/2	11 1/2	4 3/4	20 10
Monday.....	94 1/2	11 1/2	4 3/4	20 10
Tuesday.....	94 1/2	11 1/2	4 3/4	20 10
Wednesday.....	94 1/2	11 1/2	4 3/4	20 10

Tin is steady under fair business. Copper continues depressed, although the lower prices are attracting buyers. Lead shows continued strength under firm holding. Quicksilver is steady.

Mining Share Market.

Mining shares the past week under review shaded off some, and then hung around the lower quotations. Alta made several erratic moves, acting very much like a fish out of water. With well-informed operators there is a prevailing opinion, said to be founded on personal knowledge, that the Alta pool has, for a long time past, been quietly buying the shares in that group, and to assist the buying, levied assessments at regular intervals, so as to freeze out outside holders. It is claimed that the pool has about all the shares and is preparing for a false deal to peddle out the stocks. This freeze-out game, so successfully worked heretofore, is openly asserted, is being systematically carried out by the Gold Hill pool, so as to get about all of the shares of the leading mines in that end of the lode. In this little game they appear to have met their match in the combination represented by T. Whiteley & Co., stock-brokers. This combination, or outside pool, has been persistent buyers of stock, and may possibly be in position to either control several of the mines or else dictate terms so as to have the mines worked to conform to the laws of this State governing incorporated mining companies. In outside mining shares, there is steady buying of stocks, which gives unmistakable evidences of a bull campaign being near at hand. The buying is being done by a pool formed to control the stocks in each district.

The suit against the Hale & Norcross directors is throwing considerable light upon the way in which shareholders in the Comstock mines have been and are being systematically wronged—not to call it by a deservedly harder name. The suit will undoubtedly show who got the bullion.

A correspondent sends the following peculiar combination of words: It is said that President Levy of Hale and Norcross secures assessment levying of Hale and Norcross, so as to Harmonize affairs, by which to get their Marks on each certificate of shares outstanding.

Among those in position to know, and judging from Attorney Baggett's examination of witnesses in the Hale and Norcross suit, it appears that suit may be brought against several brokers who gave their proxies for voting stock not owned by them. They can and doubtless will be made party to any fraud that has been or that may be perpetrated by those who have been or may be unlawfully voted through their proxy into the directorship of any mine.

Mining shares opened this (Thursday) morning active and higher for North End stocks, but after Call quotations shaded off under inside manipulation. The market has every indication of steadily working into better position for an up move. While it may be slow at first, yet it will come, and much better prices obtain for some of the shares than have been realized at any time in this year. Outside mining shares are undoubtedly coming to the front soon, and much higher prices rule in the near future.

A correspondent suggests that M. W. Fox, in his suit against the Hale and Norcross directors, try and get at the facts about a report current that when insiders own stocks, they do not pay assessments. He claims they give their notes for the amount, and after a short time the notes are cancelled by some kind of imaginary work or in a similar way.

News from the Comstock mines is confirmatory of continued active developing work to the west on several levels in the leading mines of each group. In Con. Virginia they can show up rich ore on two or more levels, and at any time desired. In Ophir the work going on is being closely watched, and good results looked for soon. The same remarks apply to Mexican. The movement to buy up the Sierra Nevada stock may possibly stop, for a short time at least, the showing up of ore in that mine, and instead cause the levying of an assessment or two. Very little news can be had from Best and Belcher and Gould and Curry, but mining men are very hopeful of good results from the work underway in the two mines. In Savage they appear to be opening up a genuine bonanza, and are levying assessments to frighten outsiders from buying. In Hale and Norcross the outlook is of the most promising character, but the pool wants the stock, and is doing everything possible to get it. Chollar will probably show up by next spring the rich ore found to the west. Potosi and Bullion ought to come to the front soon, provided the stock is concentrated, and show up the ore found some time ago and which they have been getting into better working position. The important work now underway in several of the Gold Hill mines will be supplemented soon by still more important work, which ought to cause the shares to sell at much higher prices. In Overman, they can and doubtless will uncover considerable good to high grade ore. In the Alta group, bull reports are afloat.

From the outside mines our advices report that the Silver King mill and the Peer and Peerless mill will start up in next month. The Holmes mine is reported to be turning out more bullion. In the Tuscaroras ore is being shipped for reduction, and large bullion returns will soon be in order. In the Bodie they continue to take out ore from Bodie, Bulwer and Standard. It is reported that in Bulwer another strike has been made, but the assessment keeps the stock down, probably for inside buying.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department 10, San Francisco:

INTERNATIONAL ELECTRIC SUPPLY AND CONSTRUCTION Co., Nov. 23. Capital stock, \$5,000,000. Directors, Columbus Waterhouse, James Spiers, H. S. Crocker, C. O. Swanberg, C. S. Benedict, A. F. Johns, E. E. Parsons, C. Montgomery and Andrew Brown.

UNITED TREE AND STUMP EXTRACTING Co., Nov. 23. Capital stock, \$1,000,000. Directors, Alfred Taylor, E. J. Mahoney, T. W. Shaw, R. A. Donald and E. J. Mahoney, Jr.

WESTWARD VINEYARD AND ORCHARD Co., Nov. 23. Capital stock, \$500,000. Directors, S. J. Hendy, C. V. Manner, W. E. Lutz, J. H. Hendy and C. W. Tozer.

ACME FILTER Co., Nov. 23. Capital stock, \$100,000. Directors, M. Kraker, M. Israel, M. S. Eisner, Wm. McDonald, J. P. Currier, N. Delbance and J. Simon.

Assessment Notices.

GRANDVILLE VINEYARD COMPANY.—LOCATION of principal place of business, San Francisco, California. Location of works, Hanford, Tulare County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 14th day of November, 1891, an assessment, No. 4, of \$1.00 per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin to the Secretary, at the office of the Company, 111 Front Street, San Francisco, California. Any stock upon which this assessment shall remain unpaid on the 15th day of December, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of January, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,
CHAS. MERSFELDER, Secretary.
Office, 111 Front Street, San Francisco, California.

CALIFORNIA VERDE ANTIQUE MARBLE COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of November, 1891, an assessment, No. 1, of One (1) Cent per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, 308 Pine Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of November, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the twenty-eighth (28) day of December, 1891, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors,
W. J. GURNETT, Secretary.
Office, 308 Pine Street, San Francisco, California.

GRAY EAGLE MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Placer County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of October, 1891, an assessment, No. 2, of Four (4) Cents per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, Room 11, No. 303 California Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of November, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of December, 1891, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,
A. W. BARROWS, Secretary.
Office, Room 11, No. 303 California Street, San Francisco, California.

CALIFORNIA CREAMERY COMPANY.—LOCATION of principal place of business, San Francisco, California. Location of works, Novato, Marin County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 2d day of November, 1891, an assessment, No. 1, of Forty Dollars (\$40) per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, 111 Front Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of December, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of January, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors,
CHAS. MERSFELDER, Secretary.
Office, 111 Front Street, San Francisco, California.

DELINQUENT SALE NOTICE.

NEW EL DORADO GOLD MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Greenwood, El Dorado County, California.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 3) levied on the 2d day of October, 1891, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Share.	Amt.
J. L. Wilbert.....	94	5	\$ 25

MARK B. KERR,

Civil and Topographic Engineer,

402 FRONT ST., SAN FRANCISCO.

THE ORIENTAL GAS ENGINE

IS THE BEST, because it combines simplicity of construction with power and economy in space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosion. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

M. A. GRAHAM,

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880

September 18, 1883; July 24, 1888;

and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, l. o. b.

Price of Improved Belt Frue Vanner, \$825, l. o. b.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrator, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frue" have improved (corrugated) belts does not militate against the superiority of the "Triumph"; for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt . . . \$650 f. o. b.

Price "Triumph" Concentrators, with Plain Belt . . . \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sansome, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.
GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

Signed] Sup't North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

—MANUFACTURER OF—

BATTERY SCREENS AND WIRE CLOTH.

Agent for HOSKINS'

HYDRO-CARBON ASSAY FURNACES.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen. First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

An Electric Mine Pump.

The triplex electric pump is designed to produce a discharge of constant velocity, thus reducing the power consumed in overcoming the inertia of the water column, eliminating water hammer, and giving a smooth, noiseless and continuous action. The Gould Manufacturing Co. of Seneca Falls, N. Y., makes a special type of the triplex electric pump, with extension bed-plate to receive motor, and designed to meet the requirements of mine pumping. This is shown in the accompanying cuts. Unlike the standard pump, this is built with phosphor bronze hushed cylinders, glands and solid plungers of same metal to resist action of sulphuric acid, usually encountered in mine pumping. The connecting rods are tied to the crank shaft by solid bronze hushed strap ends having adjustment for wear. The bronze suction and discharge valves on either side of cylinder are of a simple yet heavy substantial pattern, best adapted for severe and continuous service. The construction of the pump will admit its being taken apart as may be necessary to carry into mine, and as readily put together for service. It will work against any pressure up to 500 feet lift.

As is well known, mine pumping has been generally performed with steam pumps. With the electrical transmission, pumping can be done at places where heretofore it has been impossible to operate the steam pump from the long distances which the steam must necessarily be conveyed, and because of the small space required by the electric pump in comparison.

One of the cuts shows one of these pumps placed at the sump in the main shaft. The float is placed on the reservoir which automatically controls the operation of the pump. When water falls below the predetermined point the

pump is stopped; when it rises again, the pump is started.

SEVERAL well-known mining men of this city, among them Daniel M. Burns, Geo. R. Walls,

GOULD'S TRIPLEX ELECTRIC MINE PUMP.

C. Waterhouse and M. R. Higgins, left this city Thursday to inspect the Candelaria and San Vicente mines, Mexico. The main purpose of the trip is to close up a mining deal, in

which J. W. Mackay, James L. Flood, Colonel Burns and a London syndicate are interested. Several months ago the syndicate bought the San Vicente property, in the Sinaloa district, and the present expedition's trip is almost sure to result in the purchase of the mine outright for a figure something in excess of \$2,000,000.

Silver in Europe.

News from Europe begins to indicate that there is a strong tide setting in favor of bimetalism in both England and Germany. With a change in sentiment it now looks as Mr. Seligman's mission to European Governments to promote an international agreement or conference favorable to bimetalism is likely to prove a success.

In Great Britain the great textile industry is taking up the silver question, and in every desirable way possible is appealing to the Government to enhance the price of silver by adopting bimetalism. The leading agricultural interests of that country in the forefront of this year made a similar appeal to the Government.

Russia, if we can credit telegraphic advices, is considering plans to introduce silver more generally, and in carrying out that project may convert a large part of its gold holdings into silver. By doing this, that country will be a very large gainer financially. The French, it is well known, are floating Russia's latest loan project, and as France is bimetallic it is only reasonable that Russia will be induced to take a more favorable stand toward silver than she has heretofore held.

The State Immigration Association is practically dead, from lack of interest.

Of the 450 students at Stanford University, 302 are native Californians.

ELECTRIC MINE PUMP IN OPERATION.

Rural Free Delivery.

We recently mentioned the fact that Postmaster-General Wanamaker was receiving much evidence to prove that his scheme for free house-to-house delivery of mail in country districts is quite feasible. It is a most excellent idea, and we wonder it was not sooner urged. We have come to agree that city residents should have all the improvements and conveniences, and that the country should wait upon itself. This too common belief may be found to be wrong in many respects, and it certainly is proven to be wrong in the matter of free delivery of the mails. The *American Agriculturist* has succeeded in obtaining from the Postmaster-General a short article on the subject, "Postal Delivery for Country Districts," and the theme is of such pressing importance and of such deep significance that we shall quote largely and bring the matter as prominently to attention of our readers as possible, to the end that all may take occasion to urge it upon the attention of the Congressmen representing their districts at Washington. One argument Mr. Wanamaker makes in favor of the rural residents is this:

"True enough, the village or cross-roads inhabitant, or the dweller on the farm, chooses his home for his family and might live in the city, where gas and water, and mails are brought to his door; but when people everywhere pay the same rate of postage, why should one portion of them have mail facilities denied to other portions? Is it fair to the rural localities to refuse postal service equal to that provided for the cities? Is it not a reflection on the intelligence and aspirations of the farmer and the artisan to ignore his need of the conveniences of correspondence and of supplies of newspapers and magazines? Does it not retard the settlement of country districts, to neglect to provide, in some form or other, means for at least daily intercourse with the rest of the world?"

"To carry letters, newspapers, and magazines, and leave them in an office remote from the home to be called for, is only a partial fulfillment of the duty of the Department. With the well-paid railroads, star-route contractors, and mail messengers, traversing every highway to the uttermost rock and corner of the land, there ought to be some practical way to utilize all these forces and spread the house to house delivery over almost every square mile of this great country. I firmly believe that when such a scheme is in proper operation for a year, it will be proven that the increase of revenue will fully counterbalance the necessary expenditure."

We believe this sound throughout both in its plea for justice to rural residents and in its claim that such justice will pay the department as a business proposition; and we will go further and claim that such free delivery throughout the rural districts will be of vast advantage to city residents, and second only to free delivery of their own mail matter. Trade of every kind would be fostered and quickened by daily delivery throughout the country. Orders for city goods would be multiplied, and city orders for country produce would also multiply. If a merchant or a private consumer could count upon his written order being delivered at once in the country, commercial correspondence with the interior would increase vastly in amount and importance. So, too, with advice as to markets. Great as would be the benefit of such prompt information to the producer, there would be advantage as well to the merchant. Beyond this there are social and other benefits from lifting rural communication above the occasional visit to the country postoffice, the value of which it would be difficult to estimate.

As we have stated in earlier issues, there is now in progress a limited trial of the country delivery system, and of this Mr. Wanamaker says:

"The last Congress listened to arguments on this subject, and allowed the Postmaster General to use \$10,000 of the appropriation for free delivery for an experiment in the small towns, villages and farming districts. This fact becoming known to some extent through the newspapers, applications were made for a trial of the plan; and in the order received, 47 offices in 31 States were equipped with letter-boxes and carrier service. The first 12 of these offices were designated Feb. 1, 1891, and a five months' trial is all that has been allowed up to the close of the Department fiscal year. It is, therefore, too soon to get full results."

"But it is clear from the figures at hand that the increase of revenue more than paid all the increased expense. This is a significant fact, and if the same results follow further experiments, a great extension of the free delivery is readily at hand."

This being the case it is clear that the realization of house to house delivery in country districts depends in large degree upon the persistency with which country residents demand such service from the Post-Office Department. The way to demand it is to work upon Senators and Representatives in Congress by personal interview, by correspondence, by petition and resolution and the like. Urge upon them the need of fuller inquiry into the feasibility of extending mail delivery to rural districts. Mr. Wanamaker says: "A long forward stride would be made in the postal service if the next Congress could find time to consider what are commonly regarded as the little things of Post-

Office Department, but which are really the necessary and all-important touch of the largest department of the Government upon the comfort and progress of all the families of the country, as well as of every business enterprise, great and small."

It is well to continue, of course, the great reforms needed in the postal service, postal telegraph, postal banks, etc., and even these would be more feasible, if the daily postal service were first brought nearer to the homes of the people by regular distribution of the mail, which now often lies days and even weeks in the offices because people are too busy to spend the time to go after it. We hope this subject will commend itself to the active interest of our readers.

Bituminous Rock.

Competition in the bituminous rock business says the Santa Cruz *Surf*, has been carried to the point where competition ceases and combination begins. As a consequence, all the owners of bituminous rock quarries in this county and San Luis Obispo have united in the formation of a company upon a plan similar to that of the Central Milling Company, and each individual owner has leased his quarry to the new company by which mining operations will be carried on, and the market supplied from whatever source it can be the most easily obtained.

The new company is officered by A. Walrath, as President and A. O. Bassett as Secretary, but the general superintendency and management of the business will be in the hands of J. A. Fairchild of San Luis Obispo.

The bituminous rock quarries now developed in San Luis Obispo county are immediately upon the line of the narrow gauge road which runs to Port Harford and connects with the wharf at that point. Rock quarried there, shipped by rail to Port Harford and thence by vessel to Alviso, has been delivered in San Jose at 25 cents per ton less than the rock from the Santa Cruz quarries only 40 miles from San Jose. Of course, there is something radically wrong with the transportation question when such a condition of facts exists.

It was with a view of investigating this and obtaining all information possible upon the situation, that G. M. Perne, J. H. Swift, A. E. Buckman and J. A. Fairchild of the Consolidated Bituminous Rock Company, accompanied by A. H. Walker of the S. P. C. R. R., arrived in town on Saturday evening, and Sunday made a tour of inspection of the quarries in this county and the roads leading thereto, to ascertain how much the cost of hauling might possibly be reduced.

It is a long rough road over which the hauling is now done and the compensation for teamsters is meager enough. The only way the cost of hauling can be reduced is by reducing the distance to the mines, and improving the highway.

After considerable prospecting it was decided that if right of way could be secured, it would be possible to construct a road from the mines across the Wilder ranch which would lessen the distance two miles or more.

If this could be accomplished and the county road improved on the Wilder and Moore hills, it would be possible to increase the hauling capacity of a team sufficient, perhaps, to reduce the price per ton. This, together with an amended and decidedly modified railroad schedule, would secure the entire business for the local mines, as the quality of Santa Cruz rock is superior to the southern deposits.

About 200 tons per day of rock is now being mined and the sums paid for mining and hauling amount to from \$8,000 to \$10,000 per month—not a trifling business.

The prospect for permanence and increase improves each year, as the superior value of this material for paving purposes is recognized abroad. There is work now "in sight" in San Francisco alone, which will consume 80,000 tons of rock, while with reasonable freight rates there would practically be no limit to the area of its consumption.

Although the present company controls all the quarries now opened, yet they can only hold the market by maintaining reasonable prices as fortunately the deposits of this material are extensive and there are many sources of supply as yet undeveloped.

HAND AND MACHINE DRILLING.—To prove that a quartz mine can be run at much less expense at present than it could be done in years past, the *Oroville Register* quotes a gentleman now connected with the Palo Alto mine in Butte county. As an illustration, he said they were running a long tunnel through very hard granite using an Ingersoll drill run by compressed air. The air was furnished by an engine which was run at an expense of \$2.50 a day for two men, and two cords of wood at \$1.25 a cord. The work performed was 50 feet a week in the tunnel. Five men were employed handling the drills at \$2.50 per day for each. This foots up \$17.50 for labor and \$2.50 for wood or \$20 a day or \$140 a week. One day the engine broke down and for seven days hand-drillers were at work. Seven of them were employed at \$2.50 a day, and the tunnel was driven just seven feet in the week or one foot a day at a cost of \$17.50 a foot. By using the power drills it had cost \$2.80 a foot, or it cost a little more than six times as much to do the work by hand-drilling as it did to do it by power.

A Very Rich Gulch.

The Record of Oregon Canyon.

Jauch Urey, who is engaged in writing up "Notes of the Past" for the Georgetown *Gazette*, is putting many good things into print, which otherwise would be lost to history. He was one of the early settlers of the Georgetown divide, and has a fund of reminiscences, which his interesting pen is giving to the world through the medium of the press, in the most attractive manner.

In the *Gazette* of the 19th, he has the following:

Oregon Canyon lies to the north of Georgetown; it heads nearly in the townsite and empties into Canyon creek. It runs in a northerly direction, and is over a mile in length.

From what can be gathered from early settlers, we learn that William Hudson and four others came here from Oregon in the summer of 1849. This party did the first work in Oregon Canyon. They commenced on the falls, where Hudson Gulch empties. They soon ascertained that they had discovered rich diggings, both in the gulch and in the canyon. For the purpose of keeping their discovery a secret, they did not camp near their claim, but pitched their tent some distance above. They were suspected by other parties of having rich diggings, and were watched and followed from their camp to their claim. The Hudson Company took in these watchers or interlopers as partners with them. This was done to keep the diggings a secret, and to keep others out of the canyon. The gulch they called "Hudson Gulch," and they gave the canyon the name of "Oregon Canyon."

In September, 1849, Hudson and his party wrapped their sack of gold in their blankets and put it on a pack animal and left for Oregon. Hudson said he knew of another rich canyon, and intended to come back and work it the next season. He was lost at sea on his return trip in 1850.

There was a fabulously rich place found on the west side near the mouth of the canyon. It was discovered by a company of sailors, who named it "Sailor Slide." Here gold was taken out by the pound. Ex-Senator Cole and his brother worked in this slide in the summer of 1850. From the lower end of Sailor Slide up to the mouth of Devine Gulch, which is about half a mile, it has been estimated by early miners that the canyon would average \$1000 to the lineal foot, or, in other words, \$3000 to every yard in length of the canyon. Upon the basis of this estimate, the half-mile of the canyon yielded the sum of \$2,640,000.

From Sailor Slide down to the mouth of the canyon, the ground was rich and paid well, but it was not as good as the ground above. The same may be said of the canyon above the mouth of Devine Gulch; it paid well, but was not as rich as the ground below. Now, if we assume that these two sections only paid one-fourth as much as the other ground, this would give a total yield of the whole canyon of \$3,300,000.

The gold found in Oregon Canyon was smooth and heavy; some was black, being coated with black cement, which adhered so firmly that it had to be removed with nitric acid. This same kind of "black gold" was also found in Mameluke Hill. In 1850, Alonzo Kinley found a nugget of gold in Oregon Canyon worth \$1250. In September, 1850, a man by the name of Jenkin found a smooth nugget in Hudson Gulch the shape of a goose egg, worth \$1000.

B. C. Carrier says that in 1852 he found a strange-looking piece of whitish metal in Oregon Canyon; he showed it to Prof. Blake, who pronounced it "Hessite," a rare metal, but it has no commercial value. The "black gold," the gravel and the cement howlders in Oregon Canyon are of the same character as found in Mameluke Hill. The canyon runs along the base, and heads in this hill. The water of the canyon, aided by the winter freshets, has been to work for countless ages alighting off this section of the hill, carrying down the canyon the cement howlders, gravel and other matter. After the water out a channel down to the bedrock, erosion went on, and cut a channel in the bedrock lower than the bottom of the hill. We might say that nature has sluiced out the rich channels of this portion of Mameluke and carried the gold down the canyon. It is self-evident that a large portion of the gold of Oregon Canyon originally belonged to Mameluke Hill. Oregon Canyon floats the banner for being the richest canyon in El Dorado county, and Hudson gulch takes the palm for the richest gulch.

ALASKA COAL.—Mr. F. W. Worster and Col. S. Lucas were passengers down from Ungah Island by the schooner *Maacotte*. They report that on the northwest portion of this island—the principal one of the Shumagin group, distant about 900 miles to the west of Sitka—some valuable coal mines are located. During the past four years the owners and parties interested have been doing some good work in the way of prospecting and developing the property, and now feel satisfied that they have a good thing. Besides supplying the local demand measures are on foot, it is understood, to place this coal in a large way on the San Francisco market next year. The coal veins lie one above the other 20 to 30 feet apart, numbering four to six workable veins of 5 and 6 feet from roof to floor. These veins can be traced for a distance of two miles. A tramway has been built connecting the tunnel with a 350-ton coal hunker at tide water. Two wharves and dwelling houses have been

erected and there is considerable rolling stock on the ground. By tunneling and back-stopping the coal is easily and cheaply mined, virtually inexhaustible in extent, and it is claimed that cargo lots can be delivered in San Francisco at \$4 per ton. Analysis made by Prof. Price shows it to be somewhat superior to Seattle coal, but being of a lignitic formation, as are all Pacific Coast coals, it carries a large percentage of moisture.—*Victoria Times*.

The Way to Alamo.

Alamo, the camp of the cottonwoods, says the *Lower Californian*, and the biggest gold-mining camp on the peninsula of Lower California, lies about 45 miles southeast of Ensenada, and can be reached by two routes. One leads from here across the Manadero, up the picturesque Las Animas canyon to La Grulla, and on through Little and Big Burro canyons to the divide; and if a person makes the trip on horseback, he leaves the wagon road at the latter place and goes the rest of the way by trail, passing along the entire length of Mexican Gulch—where heaps of earth and innumerable excavations show how the several thousand men employed themselves during the excitement of March and April, 1889—and after rounding the northern end of Alamo Butte, the camp comes into view. It is situated on a wide plain near the foot of Tomasa hill, on whose eastern slope some of the principal mines are located.

The other route to Alamo, and the one more commonly used, affording a fairly good road for vehicles all the way, leads into San Rafael valley and southeast across Santa Clara valley to the camp. This route is known as the stage road, and is 72 miles long, being ten miles longer than the one via La Grulla and Mexican Gulch. In order to see the famous gulch where so many nuggets were brought to light during the excitement, the representative of this paper went to the camp by the latter route. Except for a lone prospector who now and then is encountered as Mexican Gulch is traversed, it is entirely deserted. The cleared places along the banks of the creek, where atood the brush shacks and tents of the miners, give the place a decidedly desolate appearance. The supply of gold has not yet been exhausted, apparently, for a few prospectors still hold on.

Alamo is an interesting place. It is a clean-looking little town, and has some of the best and some of the toughest people on the coast. It is no more than justice though, to say that the good people are in the majority. The camp is the freest, looniest, most happy-go-lucky community on the Peninsula, but yet its citizens have a way of getting there, for all that. Altogether, Alamo is a good, healthy place, with more and better prospects than it is usually credited with having—and the flow of soul and the feast of good cheer there never ceases.

AN ADVERSE OPINION.—Dr. Franklin R. Carpenter of the D. & D. smelter was interviewed by a Deadwood (D.) *Pioneer* reporter, and asked his opinion about the McArthur-Forrest process, that just at present is occupying so much attention. He appeared to think it would not prove efficacious in the treatment of the siliceous ores of Ruby basin and Bald mountain. He said: "I have made a score of tests with the McArthur-Forrest process on the refractory siliceous ores of the country, and find that it gives an average saving of only about 60 per cent of the gold and silver. The ores were treated raw, but that is the only practicable method, as roasting would involve greater expense than the chlorination process. Experiments made on Homestake tailings were much more successful. A competent chemist also made tests on Ruby basin ores that gave but little better results than mine. Of course unfamiliarity with the process may have caused the failure in our experiments. The deadly poisonous nature of the cyanide solution would, in a great measure, prevent its use, as the least contact with the blood would prove fatal in a few minutes. The seepage from the tailings is deadly to cattle, and there is nothing in it for cow towns."

WASHINGTON COKE.—At the present time and for some years past, the Tacoma Company's property at Wilkinson has produced about 40 tons of coke per day. One vein is eminently a coke vein; it produces 65 per cent of coke, and that of a quality unsurpassed by any in the United States. The weight of the coke is 40 pounds, and it is extra hard, consequently especially suited to cupolas where it is necessary for the coke to support immense weight. Mr. Kelley, the superintendent of this property, was in former years a maker of coke in Pennsylvania, and we have seen many of his ovens on the B. & O. railway. Without doubt he is one of the most experienced coke-makers. S. G. Dawson, B. S., estimates the coal area of Washington to be about 800,000 acres, but as far as discoveries have been made, no anthracite except a vein in the Snoqualmie Pass, that is claimed to be about 18 inches thick, has been discovered, and but few veins of coking coal have come to light, yet prospectors are constantly bringing in fine specimens of coking lignite and bituminous. Skagit and Whatcom counties claim veins of coking coal, and the experiments at Sedro have been sufficiently satisfactory to establish confidence, and the Sedro Coal Co., we are informed, intends putting in a large number of coke ovens the coming season.—*Seattle Mining News*.

Mining Congress Resolutions.

Among the resolutions adopted by the recent Mining Congress at Denver were the following:

Free and Unlimited Coinage.

WHEREAS, The demonetization of silver worked a practical violation of every contract then existing in the United States, entailed uncounted losses, reduced prices more than 30 per cent, and its effect is practically to make debts perpetual, as it takes from the debtor, ability to pay, and it causes contraction in the currency, which reduces values until there is no profit left to the farmer, planter or man of small capital to depend upon, after sale of their products, for returns for their labor.

We believe the certificates of the Government, backed dollar for dollar by gold and silver coin on deposit in the Treasury of the United States, is a safe and sound currency and has been approved by the people.

The gold and silver of the West, pouring in a steady stream upon the East for 40 years, vitalized every form of business there, steadied and upheld the credit of the nation through the great war, and made resumption possible, and what we now demand is as much more to the interests of the East than of the West, as the productions of the East exceed in value the productions of the West.

Resolved, That the first National Mining Congress is unalterably in favor of the principles of bimetallism, as approved by Jefferson and Hamilton, enacted into law by Congress in 1793, and accepted by the country for all public and private business for the first 80 years of the country's history; that we believe gold and silver, not one to the exclusion of the other, are the money metals of the Constitution; that we are opposed to any law which treats silver as a commodity; that we believe that gold and silver should have by law equal rights, uses, and monetary powers, and to that end we demand of the Congress of the United States the enactment of a law by which silver shall be coined free in all the Mints equally with gold, and to have with it full and unrestricted monetary power, and that the coinage be in the ratio of 16 to 1, and when the coinage is represented by Treasury notes, each dollar shall represent 412½ grains of standard silver or 25.8 grains of gold.

Silver Certificate.

WHEREAS, By Section 3693 of the Revised Statutes of the United States the faith of the United States is pledged to the payment of its obligations in gold or its equivalent; and

Whereas, By Section 3694 it is provided that the coin paid for duties on imported goods shall be set apart as a special fund, and shall be applied, first, to the payment in coin of the interest on the bonds and notes of the United States; second, to the purchase or payment of one per centum of the entire debt of the United States, to be made within each fiscal year, which is to be set apart as a sinking fund, and the interest of which shall in like manner be applied to the purchase or payment of the public debt; and the Secretary of the Treasury shall, from time to time direct; third, the residue to be paid into the Treasury; and

Whereas, Millions of dollars of duties on imported goods have been paid into the National Treasury since the year A. D. 1878 in silver coin and silver certificates, not one cent of which has been by any Secretary of the Treasury at any time devoted to the first and second objects hereinbefore specified; and

Whereas, Every Secretary of the Treasury since the passage of the Bland bill has violated and disregarded said provisions.

Resolved, That our Senators and Representatives in Congress assembled, be requested to take without delay such steps as shall be necessary to ascertain why the Treasury department refuses to obey the statutory requirements and to insure their vigorous enforcement in the future.

Resolved, That it is the sense of the Committee on Resolutions that the question of hydraulic mining is a proper question for discussion before the Congress.

The following is the vote by States on these resolutions:

BY STATES	For.	Against.
Arkansas.....	4
Arizona.....	2

Hydraulic Mining.

The following resolution on hydraulic mining was read next:

WHEREAS, The Court of Last Resort of the State of California and the Circuit Court of the district including said State have practically inhibited hydraulic mining; and

Whereas, A commission, composed of eminent engineers in the service of the Government of the United States, has reported that mining by the hydraulic process may be conducted without material injury to the navigable streams of California, or to the interests of the owners of agricultural lands in said State; it is therefore

Resolved, That the Congress of the United States be respectfully requested to enact such law or laws as may encourage and rehabilitate the industry of hydraulic mining, upon the condition of the construction of such dams and reservoirs as may protect the agriculturists and the navigable rivers from the influx of mining debris,

Judge Goodwin moved that Chairman Searles be requested to give a dissertation on hydraulic mining.

Chairman Searles said he would gladly do so, but the talk of the Nevada and California delegations might be seriously affected, and nothing would be remembered of the brilliant efforts of the others.

The resolution was carried.

Protection of the Forests.

Mr. Crawford of Texas presented the following, which was unanimously adopted:

WHEREAS, The forests of the United States of America are being rapidly destroyed, and no adequate legislation has been inaugurated to replace the same or to stop such reckless destruction; and,

Whereas, Timber is indispensable in mining, and no doubt ever will be; and,

Whereas, We believe any generation avoids one of its highest duties if it does not, in the arrangement of all its public economies, contemplate the necessities of future generations; therefore, be it

Resolved, That it is the sense of the National Mining Congress that the legislation of the different States and Territories of the Federal Government should be directed to the prevention of further unnecessary spoliation of the forests now extant, and at the same time provide for the requirements of generations yet to come by encouraging the planting and cultivation of forest trees,

Mr. Crawford had another, which was adopted:

For the Fair.

WHEREAS, We are approaching the time of holding the Columbian Exposition at Chicago, which fair has been nationalized by the General Government; and,

Whereas, no section of the country more fully appreciates its importance than mining America; and,

Whereas, No section of the United States will receive greater benefits from its exposition of America; therefore be it

Resolved, That the National Mining Congress fully appreciates the splendid and liberal arrangements being made for the representation of mining and mining matters, and proclaims its hearty and full sympathy and support with the to-be-greatest fair and exposition the world has ever known.

Resolved, That this Congress extends its congratulations to the management of this great undertaking for the work already done, and also urges every State and Territory represented in this convention to prepare for and make exhibits commensurate with the importance of the exposition and the developed and undeveloped mining resources of the State.

Orange County Silver.

The Santa Ana (Orange Co.) Blade says: All the old silver locations throughout the county are at present showing up finely, while several new developments promise great things in the future.

A visit to the mines situated in the Silverado canyon, and about a mile above the old town site, shows the extensive workings that have been carried on there in the past year.

Dr. Danlap, one of the owners of the Blue Light mine, has been personally superintending the cleaning out of the old tunnel and making preparations for extensive operations soon to be carried on there.

The Blue Light is undoubtedly one of the richest silver-bearing mines in this section of the country. The reason that no work has been done on the mine is understood to be on account of the incongenial company as regards the owners—a desire being made to “freeze out” somebody. Of course, this is only rumor.

It will be greatly to the benefit of the county generally that this mine be opened up. There will be no necessity either of melting or concentrating works erected in that event, and the other mines already opened on the hill will be benefited thereby. The great distance from melting works, where returns may be obtained is a serious drawback to all the mines of the mountains. It takes a vast amount of capital and labor to open up and develop a mine, and should the surroundings offer further obstacles, in the way of reducing the ore, access for teams to the works, etc., additional sums of money and more hard work is required.

For many long weary months the Pellegrin mines have been prospected and worked, and only a short time ago was capital found to purchase a controlling interest, that the mines may be properly developed. A joint stock company has been formed, and a large force of miners is now actively engaged upon the works. These mines have rich assay returns, and although the ore must be sent to San Francisco the assays are most encouraging.

It is now contemplated to erect, near the Pellegrin mine, smelting works, and when these are completed, large sums of money will be saved. Custom work will also be received, and all mines will be benefited in their turn.

In the Trahna canyon may be found many rich developments of silver, and the persistency of the prospectors at least shows the faith they have of the future wealth in store for them.

The late strike in the San Juan canyon, situated about nine miles north of the Hot Springs, has awakened a new interest in mining circles, and the old prospectors are jubilant. A four-foot vein of lode matter, said to assay about \$400 per ton, has been laid bare, and now that the hard work of discovery and prospecting has been finished, capital may be expected to step in and further the operation of extracting the ore and developing the mines.

As the county becomes more thickly settled, and wealth is offered as an inducement to come and locate, the many embryo advantages of the county will be taken up and worked to successful issues.

The Steam Sleigh.

An Invention Being Constructed in Truckee.

Truckee is likely to exhibit a piece of mechanism this winter that will revolutionize life in snowy countries, says the Truckee Republican. If the invention is a success, there will be no more trouble in paying a visit to the North Pole than there is going to the Sandwich Islands. In fact, excursions to the North Pole will become almost as popular as trips to the World's Fair. But the invention is not being perfected with the sole view of making Arctic excursions. There is something a vast deal more practical, namely, the traversing of snow-covered fields and mountains with a speed that will be scarcely less than that of railroad trains and the hauling of mammoth loads of freight, saw-logs or whatever else may require cheap and speedy transportation. All that is needed is that the ground be covered with snow, and although tropical countries will not be in it, all those portions of the globe that can boast genuine winter weather will come to Truckee and learn how to run snow railroads without the expense of laying iron tracks. The invention is secured by the necessary patent applications, and the perfected machine is now being built in Truckee. No one who has seen the plans and working models finds anything in the machine that is not perfectly practical. George Schaffer, the wealthy mill-owner, is having the sled built. He has the well-earned reputation of being a practical man, and when he backs an enterprise with coin, it must at least appear feasible. Mr. Amos Lane, the inventor, has kindly exhibited his plans to a reporter, and although a better idea could be conveyed by illustrations and cuts than by words, the main feature of the novel machine can perhaps be shown by mentioning the bare principle upon which it works. Given two broad sleigh runners placed a trifle farther apart than in the usual sleigh. Between these, in the front and hind portion of the sled, are two cylinders from two to six feet in diameter, strong enough to support a revolving belt. These cylinders, of course, are at right angles to the runners, and are so adjusted as to be easily raised or lowered. On the belt, also at right angles with the runners, are attached V-shaped cleats, which extend entirely across the space between the sleigh runners, being on the exterior of the belt. The general appearance of these cleats might perhaps be understood by imagining a strong belt on the inside of the following V's, represented by a dotted line, and that the belt revolved on the cylinders O. O.

Now if the cleats on the revolving belt just touch the surface of the snow, being so regulated that they can take a less or greater hold upon its surface, any one can understand that when the belt revolves, the sleigh runners must be propelled forward. The revolution of the belt is accomplished by a steam engine placed in the sleigh and connected with the cylinders. In the machine now being constructed, a vapor engine will be used instead of the ordinary steam engine, because it is lighter, and the sleigh now being built is intended only to carry passengers to Donner Lake, Tahoe and points around Truckee. The steering apparatus is merely a sort of rudder, or running board, which glides along on the snow a few feet in advance of the sled. This can be deflected to either side by turning a lever, and the sled will follow its motion. There are a number of interesting details about the machine which cannot be described in a brief article. The main point of the invention is the belt and cleats. It will readily be seen that the pointed shape of the cleats will prevent the snow from clogging them, and at the same time they will keep a firm hold on the snow, whether it is hard or soft. They will not injure the road, but, on the contrary, the roadbed will become better after each trip. Judging from the speed made by the working model, it will be entirely feasible to make ten or twelve miles an hour over ordinary roads, and where the country is level, there is nothing to prevent a speed of 60 or 70 miles an hour. On ice, the points of the cleats will be tipped with rubber.

The Refinery at Park City.

The Park Record (Utah) says: The experiment of refining the sulphides produced by the Marsao leaching plant by Stedefeldt's process is beginning to be a reality, and may even now be considered a complete success, as the remaining processes the matte has to go through are comparatively simple. The plant has been thoroughly tested down or up to the point where the copper is dissolved from the silver and gold by means of a sulphuric acid bath, and works to the entire satisfaction of Mr. Stedefeldt. It was calculated to manufacture a solution of sulphuric acid strong enough to dissolve the copper from the sulphur fumes arising from the matting furnace, but it proved to be too weak, and hence the acid will have to be purchased. Mr. Stedefeldt is satisfied with developments so far, and left for the West yesterday morning to make arrangements for acids and several other minor matters. He will stop at Butte a few days to look after a leaching

plant that is about ready to start up at that point, and then go to the coast, returning to the Park in about two weeks. A test of the product at its present most advanced stage showed an assay of 997 fine in silver and one of gold, which is nearly the pure stuff and indicates that when the process is complete and the bullion run into bars, it will be absolutely pure. The plant, it is understood, will be under the supervision of W. H. Bond during Mr. Stedefeldt's absence.

Electricity for Mining.

Mention has already been made in these columns, says the Montana Mining Journal of the proposed utilization of the Flint Creek falls to furnish power to different points. The scheme is further explained in a Phillipsburg special dated the 2d inst., which reads as follows: Seven miles from here, on the headwaters of Flint creek, works are being constructed which, when completed, will furnish power for all the mining camps near here. The Flint Creek Electric Power company was organized last June. The object is to utilize the series of falls that exist on Upper Flint Creek. The incorporators are C. M. Bennett, of Virginia City and Baker and Harper of Butte. The capital stock was fixed at \$25,000, with privilege of increasing at any time. This sum has already been expended this fall, and it is estimated that when completed the works will cost \$100,000. The incorporators have been watching this stream for several years, and find that they can depend upon from 2,000 to 3,000 miner's inches of water. In order to utilize this power a flume 6,600 feet is being constructed along the mountain side. The flume is three and one-half by four feet, and there are two tunnels, one 360 feet long, and the other 710 feet. The excavation for the flume has been completed, and the lumber is on the ground ready to be put in place in the spring. The dam is constructed of rock, is 100 feet in length, 12 feet high, and has a waste weir of cast iron pipe worked with automatic valves. The water supply comes from Georgetown flats where a number of springs exist. As the water issues from the ground it is warm and no danger is anticipated from the water freezing, as the distance to the works is so short.

At the end of the flume a tank with a capacity of 35,000 gallons will be built. From this tank a steel pipe, 30 inches in diameter and 1,300 feet in length, will extend down the side of the mountain to the power house. The tank is 658 feet higher than the power house, so there will be a fall of over 2,000 inches of water, 688 feet, or equal to 2,000 horse power. In the power house the main pipe branches into a number of smaller ones, by means of which ten Pelton water wheels will be fed. These wheels are high pressure and are capable of running ten dynamos. The entire power can be carried on ten heavy copper wires. In order to use power, motors are required at the end where power is used. It is probable that this power will be used at Granite, Anaconda, Rumsey, Phillipsburg and possibly at Butte. The plant is 17 miles from Anaconda and the company can deliver 80 per cent. of the power sent out; seven miles to Phillipsburg, and Granite and Rumsey, and they can deliver 90 per cent; they could deliver 65 per cent. to Butte.

It is probable that this power will be used in Anaconda for refining the copper, which at present is sent away for this purpose. There is already an electric refinery at Anaconda, which is said to be a success. The company began work August 13, and has completed the dam, the excavations for flume and pipe line, and expect to complete the tunnel before Christmas. Since the work began about 300 men have been employed. They expect to complete the work early in the spring. They erected a two-story boarding house with accommodations for nearly 100 men and have also provided a reading room for their employees. The company has an office at the works. When completed these works will be more extensive than any other of their kind in America.

RICHARDSON'S STEAM WAGON.—The steam wagon of the Richardson Bros. is making regular trips every day from the mill to the lumber yards below town. The distance is eight miles, yet the amount of lumber brought in every day is from 25,000 to 30,000 feet. Five wagons loaded with lumber constitute a load. When it is known that Mr. Richardson is really the inventor of the best portions of this wagon, Truckee should feel justly proud of its success. There is no reason why the steam wagon should not play an important part in the future of this region. If we must bide the time when business demands a railroad Tahoe and Sierra valley, we can at least know what roads for steam wagons could be built at once, and the expense fully justified by the freightage that could be obtained.—Truckee Republican.

A GOOD AIR WHEEL.—The Pelton wheel will run beautifully with compressed air. This afternoon water was turned into the new pipe which has just been laid on Mill street. The Telegraph pipe, that conveys water against the Pelton wheel that runs the press, was attached to a new water main. That main was filled with air which the water compressed and forced into the small pipe and against the wheel. The air was driven out with great force and before any water impinged on the buckets of the Pelton wheel the machinery ran most beautifully. The air made much more noise than does the water.—Grass Valley Telegraph.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA

Amador.

SUTTER CREEK.—Cor. Amador Ledger, Nov. 28: Sinking is going on at a rapid rate at the Wildman mine. They are now preparing to put in the eighth set of timbers. Calculations are now being made to start the mill again about the first of next month. The mill, during the brief period of idleness, has undergone a thorough overhauling, and will be in the best of order when the stamps are again set in motion. At the Hector, timbering and repairing the shaft will soon be finished, and the work of taking out the water will be inaugurated, which will take about a month to complete. The old pipe carrying water to the Belmont mine is being taken up, and the work of digging the ditch deeper in order to accommodate a new and larger pipe is in progress. Tunnel No. 1, is still being driven on the vein, and I am told they have cut some rich ore in the prosecution of this work, which they are saving and running into the ore bins. Several thousand feet of lumber have been delivered at the northern part of the claim for building a hoist over what is known as the old Boss shaft, which is to be sunk several hundred feet deep. This portion of the mine has never been prospected, embracing a distance of some hundreds of feet of virgin ground. The Lincoln is in operation and the ore is said to be paying well. The South Eureka is looking more and more favorable as sinking progresses, and the promoters are feeling very confident that the property will develop into a big paying mine.

WILL PAY.—Amador Ledger, Nov. 28: Everything indicates that the present operations at Quartz Mountain will turn out a success, and develop one of the largest mining enterprises in the county. Here, Nature has piled up inexhaustible stores of gold-bearing quartz, from which fact the deposit has been appropriately named Quartz Mountain. The gold is contained in fine sulphurets of high grade, said to yield as high as \$500 per ton. The sulphurets, however, are exceedingly fine, and have heretofore baffled all efforts to save them in paying quantities. Several appliances were tried, but all with poor success. A. B. Call, who has done a great deal in the way of handling sulphurets at the Gover, determined to tackle the quartz of this vicinity, putting in a sulphurets-saving plant after the Gates' method used at the Kennedy. The outcome has proved so satisfactory that the 10 stamps originally started are being reinforced with 10 additional stamps, and it is said 20 more will be added in the spring. Other claims about the old mountain are being revived, and the settlers thereabout are firm in the opinion that, after repeated failures, the district is at last entering upon a period of solid prosperity.

MISCELLANEOUS.—A cleanup has been made at the New York mine, being the first run of the large Huntington roller quartz mill recently erected on that claim. We are unable to give the exact result per ton, but the output is said to be something over expenses which is considered quite satisfactory for a first run on low-grade ore such as is met with in this claim. There are large deposits of quartz, which those well acquainted with that section say will pay if handled economically. The Stewart brothers are putting up a three-stamp Donnelly mill on their claim between Butte City and the Mokelumne river. The work of repairing the Amador Queen mine will be commenced to-day. Ed Kay and other carpenters have been engaged for this purpose. It is the Amador Queen No. 2, in Murphy's gulch, that is to be started up. This property, also the millsite, has been redeemed from the sheriff's foreclosure sale. Amador Queen No. 1, has not been redeemed, and the period allowed for redemption has expired.

Butte.

MAGALIA RIDGE.—Oroville Register, Nov. 29: The Butte Queen Co. has let a contract to run a tunnel 350 feet, so as to drain both the Butte Queen and the Butte King mines. When this has been constructed, these mines can be worked without having to pump any water from them, thus saving a large expense in working. Mr. Blagraves of S. F. has recently been elected president of the Butte Queen mine, and work under him will be pushed ahead with great vigor. D. K. Perkins has a force of men at work taking out ore, and this ore is of a rich grade. In the spring, a mill will begin crushing the same, when it is certain very profitable returns will be made. A large force of men are at work in the Mineral Slide. A Red Bluff company is opening what is known as the Linsey Bar gravel mine. Lumber is being hauled to the mine, and work is driven ahead with great expedition. This is on the lower end of Brown's ravine. The Harris & Patterson mine is being developed extensively. No work is being done at present in the Carr mine, nor will any be done till spring. The Gregory, Doyle & Co. mine has shut down till spring; owing to the depth of snow where that mine lies, it is difficult to work it in winter. Rich pay gravel is being taken from the Pershaker mine on the West Branch. This mine is certain to turn out much gold if a force of miners is employed. Astonishing reports come from the silver ledge near Lot's Lake. The owners have shipped a good deal of the ore to Denver, and the least that any of it has returned has been \$300 a ton. From this to \$700 has been what the ore yielded. The ledge is 37 feet wide, and ore has been taken from it at a distance in length of 400 feet. The shaft is down over 80 feet. It is thought by those who have examined this ledge that it will prove the richest silver ledge ever found on the American continent. One gentleman who is posted about the mine tells us that he is confident, that within two years, 500 teams will be engaged in hauling ore from the mine to the nearest railroad station for shipment to Denver.

GRANITE BASIN MINES.—The See & Jolly mine is turning out well and will prove very profitable. Arthur Christie has struck the vein in the Mexican, and has a large amount of quartz in sight. Wesley Bowers has found good rock in the shaft he has been sinking. The ledge is large and grows better as the shaft is sunk deeper. W. C. Graves, during the summer, took out considerable ore and crushed it in his four-stamp mill, which paid well. A. Swan has rich rock yielding from \$25 to \$30 a ton of free gold, besides being rich in sulphurets. Frank Early, dur-

ing the summer months, huilt a ditch and put up an arrastra to work some good rock.

Humboldt.

WILLOW CREEK MINES.—Blue Lake Advocate, Nov. 21: We may say that negotiations, which for some months have been pending, for transfer of the Willow Creek gravel mines to a San Francisco gentleman have practically been consummated. The claims, which thus pass into the hands of Mr. Murray Bailey of San Francisco, are scattered all the way from the South Fork of Trinity to and including P. F. Bussell's mine. They are gravel claims situated in the old bed of Trinity and are a valuable property. The impression prevails that Mr. Bailey is acting as the agent of English capitalists, and that this mining property will be in the hands of those with ample means for its full development.

Inyo.

PINE MOUNTAIN.—Register, Nov. 28: Mr. Douglass, representing Adams & Carter of San Francisco, manufacturers of the Frue ore-concentrating machines, has been engaged in putting up two of the machines at Pine Mountain. At that place, by the way, results are so far very satisfactory. The ore, of which there is a large supply, is crushed and concentrated, then shipped.

Mono.

DUNDERBURG.—Cor. Tuolumne Independent, Nov. 28: Work on the Dunderburg will be suspended as soon as the storms begin. The ore shipped to S. F. gave very satisfactory results, so much so in fact that the company has started a tunnel from Green creek that will tap the vein at a depth of over 1000 feet. The distance to be run is in the neighborhood of 3000 feet, and as the whole country is full of ledges we have no doubt many important strikes will be made before reaching the Dunderburg. This is regarded as the most important undertaking yet commenced in Mono county. It is too late in the season now for the company to get in machinery and erect the necessary buildings, but just as soon as spring opens it will be on the ground and the tunnel will be driven with the utmost speed. In the meantime two shifts will be kept at work steadily.

Nevada.

NORTH BANNER MINE.—Grass Valley Tidings, Nov. 28: With the new shoot of ore cut in the North Banner shaft, about three months ago, a large body of water was tapped. After some weeks the shaft was freed of water, but it has since developed that to carry on operations at the depth attained and greater depth, heavier machinery will be necessary. The altitude of the ditch from which water for power has been obtained, is not high enough, compared with the altitude of the works to furnish adequate pressure for a new and heavier plant, hence new power must be provided as well as new machinery. The management is figuring on the cost of raising the shaft from the tunnel to surface and erecting a steam plant. A plant with electricity as power has also been figured on, but we understand that the companies manufacturing electric power plants of this kind will not give a guarantee such as the management requires to protect the mine-owners in event of the failure or partial failure of such a plant. In all likelihood, the shaft will be raised to surface and a steam plant erected. It is estimated that the improvement will cost \$10,000.

THE PROVIDENCE MINE.—Transcript, Nov. 23: The San Francisco company that recently came into control of the Providence mine evidently means business. Col. Carl Davis, the experienced and successful mine manager, who is officiating as superintendent, has about 20 men at work now engaged in putting everything in shape for turning out gold. A large air compressor is being put in, and four tons of air pipe arrived this week. Pumps amply powerful enough to handle the water with ease are to be introduced. The shaft is being re timbered from the surface to the 1200-foot level, wherever the old timbers show signs of decay. The work of extracting the ore bodies now in sight and of opening up the "back" ledge is to be crowded. It is expected that before many weeks the entire complement of 40 stamps will be dropping again. The Providence is in a fair way to resume the place it held for so many years as the principal lullion producer of this district.

IMPORTANT FIND.—Grass Valley Union, Nov. 25: On the 2100 level of the North Star mine, 250 feet west of the shaft, the vein has opened out to the width of eight feet, and what is important, the ore is of excellent quality, showing in leaf gold. The widening is caused by the coming together of two veins, which will probably be the means of the vein continuing of large size in driving farther to the west and in the levels that may be opened at a greater depth. The find is very encouraging and will add to the reputation of this already valuable mine, which has been rapidly developed under the energetic management of Superintendent E. R. Abadie.

OSBORNE HILL MINE.—Grass Valley Union, Nov. 28: The bonding of the Osborne Hill mine to E. T. Wiltse, who represents a strong company, was completed on Wednesday, the bond being for two years. The mine, which is incorporated, is owned by Wm. Campbell, Mrs. J. L. Smith and Robert Smith. It is the intention of the new company to put up steam hoisting works of sufficient capacity to exploit the mine considerably below the old workings. The Osborne Hill at one time was a noted mine, and there is every reason to believe that the property is very valuable, and only needs good management to be worked to profitable success. The location, which is 2000 feet in length, is on the Osborne Hill range. The rich character of the ore produced by the mine is well known to the old-time miners of the district, who regard the contemplated reopening of the mine as an enterprise amply justified by its history.

Orange.

THE SANTIAGO MINES.—Anaheim Gazette, Dr. R. S. Law, representing the San Francisco and Los Angeles syndicate who some four months ago bonded the Santiago Mining Co.'s mines east of town, was here Tuesday and engaged a force of 25 men to construct a wagon road from the mines to El Toro, the nearest shipping point. D. J. Sorenson was engaged as foreman of the work and will leave for the mines with his men, tools and outfit to-day. The building of the road will require about a month's time, but it is expected to have it finished before the heavy rains set in. He states that the four months' development work done at these mines

during the term of the company's bond has so well satisfied his people that they have decided upon at once commencing a systematic development and improvement of the property, and some very large contracts have been let in San Francisco of which we will be permitted to speak in the near future. Suffice it to say at present that mining will hereafter rank as one of our leading industries, and the opening of these mines will be of especial direct benefit to Anaheim. Considerable quiet work has also been done during the year in the Silverado mines, and some good deposits of ore have been uncovered which will assay well, and of which a large quantity is now on the dump and awaiting shipment.

Plumas.

PROSPECTING.—Bulletin, Nov. 28: More prospecting is being done in the vicinity of Quincy than for years. Jack Fogarty has been engaged at Clearmont, but has quit for the winter. He was working in gravel and has good prospects ahead. Terry & Johnson have also been prospecting near the same place, and they are reported to have a good outlook. Morton is at work on Shore's Hill. Wornley & Richards continue work on their claims known as the White Oak and Black Oak. They have run over 300 feet of tunnel in the direction of the ledge. The indications are that they will develop a good mine. Ex-Senator Kellogg is also doing prospecting work on the hills above Elizabethtown. That section of country has been famous for its rich product of gold.

CHINESE MINERS.—Yreka Journal, Nov. 28: The Chinese who own the Benz Bar claim, on Klamath river, according to the belief of careful observers, have taken out not less than \$200,000 during the past two seasons, and as high as \$10,000 in a single day. The Chinese at work in the claim are close-mouthed, and will not tell what amount of gold they are taking out. Several miners are positive this claim is paying even better than the old Kanaka mine, just above, in its best days, where 400 ounces were taken out in a single week.

QUARTZ VALLEY.—Senator R. H. Campbell has sold his Quartz Valley hydraulic claims to an English syndicate, who has formed a company known as the Quartz Valley Gold Mining Company of California, limited. The capital stock is to be \$105,000, or \$525,000, and the working of the claim is to be under the supervision of Chas. Roberts of Oakland, as manager and engineer, who has been in London negotiating the sale. This sale to capitalists is a commencement from the Act passed by the Legislature repealing the law declaring Klamath river a navigable stream, with certainty of more sales and opening of deep placer mines throughout the entire northern part of the State that will pay handsomely if capital is invested to develop them. The quartz-mills on Humburg creek are kept running constantly with an abundance of quartz to continue operations day and night; in fact, more quartz-mills are needed to supply the demand from various new claims now being opened on Humburg and in this vicinity. A first-class custom mill on Yreka Flats would no doubt pay handsomely in crushing quartz from Humburg Gulch, Greenhorn, Cherry Creek and various points along the east side of the Humburg range of mines, or dividing ridges between Yreka and Humburg creek. The Schroeder & Werner quartz mine at Deadwood continues to yield good pay as usual, and in a few days more a night shift will be placed in the mill, to crush day and night during the winter season. The work of running an incline shaft on the coal mine at Willow creek is continued steadily, developing a fine deposit of coal that will prove highly valuable in the near future, when taken out in large quantity to supply the market. The company has already expended between \$5000 and \$6000 in prospecting and opening the mine, taking out considerable coal at the same time.

FROM GRANITE BASIN.—From Mr. Waldron, who was in from Granite Basin Monday, we learn that Mr. Swan is crushing some very rich ore from the Homestake mine. That previously crushed yielded as high as \$25 per ton, and the indications are that the ore now being milled will yield a great deal more. Mr. Swan has a five-stamp mill, run by water. Mr. Waldron is very much elated over the outlook for the property, which he and Mr. Hubbard have bonded. See & Jolly are extracting ore from their mine to crush next spring. The ore is of high grade. It is expected they will make a fine run next season. Mr. Graves continues work on his mine, from which he crushed ore all last summer.

THE GOLDEN GATE QUARTZ MINE.—Plumas Co. Bulletin: This property is about eight miles northwest of Quincy, and is owned by Messrs. J. B. Sutton, Jo Braden, Henry Orr, Wm. Richards, E. J. Barker and J. W. Larson, who located it last spring. It had been worked in early times, and was then known as the Jackson mine. Quartz was then not much sought unless very rich. The more the present owners investigated their property, the more were they satisfied that they had a good mine. They proceeded with development work, and with improvements. A five-stamp mill was fitted up, roads and cabins built and the extraction of ore begun. Crushing began about the first of August. The owners inform us that the product of gold was such as to yield the company a handsome profit. The mine is full of promise. The ore vein, from 1 to 6 feet, has been traced 3000 feet on the surface. During the past two months the mine was in litigation, but the title was settled in court last week. Development work will continue during the winter, and the crushing of ore will be resumed next spring.

RICH CHIMNEY OF ORE.—From Supervisor Thompson, we learn that, several days ago, a rich strike was made in one of the tunnels of the Halstead mine at Rich Gulch. Assessment work was being done in what is known as the English tunnel, well up on the side hill, which had been run to crosscut the vein. The vein had been reached, and the men were following it when they struck into a rich chimney of quartz, which shows free gold. It is considered a high grade of ore, but the extent of the chimney is not yet known. The ledge is about six feet wide. The property is owned by the Halstead Bros., who are much elated over the discovery just made.

San Diego.

OUR GOLD BANK.—Julian Sentinel, Nov. 28: Despite the bank failure, work among the mines is steadily progressing. This is where Julian over-reaches her neighbors of the coast. We have a great, rich and exhaustless bank among the auriferous veins that course our hills. Many men are at work constantly endeavoring to reach the bottom,

but like the magic pitcher of old, the bottom never comes.

Shasta.

PLACERS.—Redding Free Press, Nov. 28: Mr. Hiatt of Buckeye is hard at work digging a race and getting ready to work rich placers by the time the winter rains set in. W. D. Biegle showed us some rich rock from a new discovery above Shasta. He says that he is interested and has enough ore on hand to ship. Kirk Spaulding was in Redding on Wednesday with a fine sample of ore taken from his mine on Nigger Hill, a mile and a half from Shasta. He has a 12-foot ledge, rich in free gold and sulphurets. John Tiffin, the pioneer placer miner, is making good wages in the Lower Springs district on an old location rich in pockets and seams. At present he is fixing up a mammoth self-shooter, intending, when the water comes, to wash off the entire hill. Joe Penrose of Shasta informs us that he has bonded his mine on Gambler's Gulch to San Francisco parties for \$10,000, the bond to hold good for eight months. Aug. Blohm of Mott, who, with his wife, was in Redding Thursday, informs us that, with J. W. Hare, he obtained a sack of auriferous sand from the bar at the head of the Sacramento river below the Indian rancharia, the place where, a few years ago, Fred H. Deakin conducted a placer mine. This sand was obtained at the instance of Walter Deakin and has been shipped to Colorado, where a company has extensive machinery erected to work gold-bearing sand. It is claimed that sand yielding 50 cents per ton can be successfully worked. If, upon investigation, the sands prove rich, a plant costing \$40,000 will be erected here.

NEW MILL.—Shasta Democrat, Nov. 25: A new stamp mill will shortly be put up on the Little Nellie mine, Iron mountain. Mr. Hart, the proprietor, will make extensive developments on the mine this winter.

BULLYCHOOP MINES.—The great mining suit of Cromwell vs. Foster, et al, came to an end in the Supreme Court, last Thursday. The decision of the lower court was affirmed, in favor of Foster, et al. The litigation was over the Bullychoop mines, and the decision leaves the property free from entanglements.

TELLURIUM.—More telluride ore, also carrying free gold, showed up in the west drift of the Salt Creek tellurium mine a few days ago. Peter Scherer, the superintendent, is in San Francisco.

Trinity.

GLOBE.—Trinity Journal, Nov. 28: J. N. McDonald came in from the Globe mine this week, having completed the construction of the mill and got everything in running order. The job was quickly done, and from what we have learned, we judge it is well done, and all that is now needed is a little water to supply the boiler and battery.

HAND-MORTAR ROCK.—Shasta Democrat, Nov. 25: We hear that Jack Strode, of Whiskeytown, and another party, recently located and are now developing a very rich prospect in Trinity county, near J. E. Carr's ranch. They have a big ledge, from which they are taking out hand-mortar rock.

Tuolumne.

BONANZA.—Tuolumne Independent, Nov. 28: The Independent is authorized to announce that the Bonanza mine, which has been closed for several months pending the outcome of a dispute between the owners of the ledge and the owners of town lots under which it passes, will shortly be reopened. This will be pleasant news to the citizens of Sonora, as over \$4000 per month is disbursed at the mine, and it is in every way to the interest of the town and county that this mine, which has already produced millions of dollars, should be worked. It is understood that work will proceed only in certain portions of the mine until the suits are finally disposed of.

BADGER.—The tunnel of the Badger mine is now in 225 feet, and within about 71 feet of the chute. A shaft was first sunk on the vein to a depth of 220 feet. The vein averaged four feet in thickness, and a milling test of surface rock showed \$9 per ton. Ore was found in the shaft from surface to bottom. The tunnel is being driven with a view of tapping the vein 700 feet north of the shaft. The exposure of such a body of ore with a chance to stoep will of course add greatly to the value of the mine. The property is owned by a Gilroy company, of which Geo. Stayton is a member and superintendent.

SARATOGA.—The Saratoga Mining and Development Co. is still pushing work at the Saratoga mine on Harding's ranch, or Fales' place, near Shaw's Flat. Mr. Fales bored a hole some 15 years ago on top of Table mountain, and reached the gravel of the ancient river-bed. He then ran a tunnel into the side of the mountain, but at too great an elevation to intersect the old river-bed above the water level of the basin. He was, therefore, compelled to abandon his work. The Saratoga Co. commenced lower down, in order to secure drainage. They have worked two years and three months on the tunnel, and are now exactly 500 feet from the point of beginning. One hundred and thirty feet of the rock had to be blasted. They are now very close to the old river-bed, having recently passed through the rimrock, or syncline. The miners think they are not more than 75 feet from the trough, and perhaps much less. The gravel of the ancient river channel under Table mountain is known to be very rich, and this company surely deserves a rich reward for its persistency.

Yuba.

NEW WORKS.—Grass Valley Tidings, Nov. 28: The Jefferson Gold Quartz Mining Co., comprising Marysville citizens operating in Brown's valley, Yuba county, are arranging to erect hoisting works and a mill that will crush 200 tons per day. But little intelligent work has been done in the Brown's Valley district since the early days.

NEVADA.

Washoe District.

ORE EXTRACTED.—Virginia Enterprise, Nov. 28: There has been no change in the quality of the ore being extracted from the stopes on the 200 level of the Belcher. The battery samples show an average value of \$21.26 per ton. The old north lateral drift on the 300 level, which is being re timbered and repaired for the purpose of getting under the ore in the 200 stopes, has been cleaned out 68 feet. When the ore is reached from this drift some new developments may be expected. The ore in the winze on the 1350 level of the Alta remains about

the same. This ore undoubtedly extends down to the 1450 level. The Cornish pumps will be overhauled and started as soon as possible and the water drained from the 1450, after which they will drift in and intersect the ore and then upraise and connect with the winze. This will give about 130 feet of backs for stoping, as the winze is an incline one.

SAVAGE.—During the week we have hoisted 723 cars of ore from the 500, 750, 950, and 1100 levels, and shipped to the Nevada mill 525 tons, and milled 530 tons; average battery assay, \$18.50. We have bullion on hand amounting to \$21,284. The west drift from the new station, Potosi tunnel level, was advanced 27 feet, making its total length 700 feet from the shaft; face in low-grade quartz. On the 1100 level west crosscut No. 1 was advanced 25 feet, making its total 116 feet; face in clay and quartz. On the 1450 level the northwest drift is advanced 120 feet. We have temporarily discontinued work in No. 2 west crosscut, 1500 level, also in the upraise, Suro tunnel level. We have shipped 56 tons of ore to the Mexican mill to be worked by the new Japanese process.

CONFIDENCE-CHALLENGE.—The joint Confidence and Challenge north lateral drift, 200 level, is 872 feet from west drift from Yellow Jacket shaft, 12 feet having been made during the week; face in quartz of no value. The joint Confidence and Challenge drift on 300 level is now in 545 feet, 13 feet having been made during the week; face in quartz of no value.

HALE & NORCROSS.—On the 1630 level the north lateral drift from the new station is advanced 50 feet; face in clay, quartz and porphyry. On the Suro tunnel level the north drift started from the station, was advanced 25 feet; face in porphyry and streaks of quartz. From the face of the west drift, started south of the side of the incline, we have made an upraise for a chute 25 feet, and connected with the west side of the incline. This chute, which will answer for dumping purposes for all rock from the upper levels that may be sent through the Suro tunnel, will be finished the coming week. Have sent through the Suro tunnel 532 cars of waste rock during the week.

JUSTICE.—The east drift, 622 level, was cleaned out and retimbered 18 feet during the week; total, 148 feet. Started a raise on the north line, 822 level, which is up 13 feet in ore of fair quality.

SEG. BELCHER.—The main west crosscut from the south lateral drift, 600 level, has been advanced 19 feet during the week, making its total length 441 feet. The face is in a mixture of porphyry and low-grade quartz.

SCORPION.—On the 900 level the joint north drift from the Union shaft is now advanced 636 feet; face in porphyry and slips of clay. Water from the face of this drift about the same as at last report.

KENTUCK.—The north drift from the Crown Point, west crosscut, 500 level, has been advanced seven feet, and is now out 99 feet. Have started a west crosscut from it at a distance of 85 feet in or about 50 feet in Kentucky ground. The face is in porphyry and low-grade quartz. Are still opening on the pay streak south, above the south drift from the north raise, 1000 level, with no special change to report for the week. The east crosscut from the north winze, 1000 level, is out a total distance of 31 feet. The face is all in quartz of low grade, with isolated spots of ore through it.

BELCHER.—North drift from the 300 level station is now out 68 feet, having been cleaned out and retimbered 42 feet during the week. There is no change to report of the 200-level stop since last report. Have shipped to the Brunswick mill 146 tons and 980 pounds of ore, from which we have so far received two battery samples which average \$21.26 per ton.

YELLOW JACKET.—Shipping 40 tons silver-bearing rock to the Vivian mill daily, and 100 tons of gold-bearing rock to the Santiago mill. The usual prospecting work is being done.

CROWN POINT.—East crosscut No. 1, 500 level, is out 66 feet, having been extended 24 feet since last report. The face is quite wet, and is composed of porphyry and quartz, giving low assays. The west crosscut from the south lateral drift, 600 level, was advanced 24 feet, and is now out a total distance of 255 feet; face in porphyry with small streaks of quartz through it.

CON. CAL. AND VA.—There has been extracted from all parts of the mine during the week 1012 tons of ore, which was shipped to the Morgan mill. The average assay value of all the ore worked at that mill during the week (980 tons) was \$23.10 per ton. Bullion shipped to Carson Mint, assay value about \$11,676.89.

ARIZONA.

WEAVER.—Mohave Miner, Nov. 24: A number of miners came in from the mines of Weaver district last Saturday. From their statements the country for miles around is one mass of ore running from \$10 to \$500 per ton. There are now about 60 men at work in the camp and more are going in there daily. The two mills will be in working order by the 1st of January.

THE RAINBOW is being steadily developed, 10 men being employed. The upper tunnel is being driven into the mountain and two drifts run from the bottom of a 50-foot winze in the lower tunnel. All the works show plenty of good ore, enough being taken out in development to pay all expenses. Five hundred sacks of ore were packed down to the landing at the Rattler landing last week, and 300 sacks still remain on the dump awaiting shipment. Some wonderfully rich ore is being encountered in the bottom of the main shaft of the Distaff mine at Chloride. A 30-pound chunk of solid native silver was recently extracted and forwarded to Denver, Col., as a specimen, and solid chunks of native silver as large as one's fist, are being taken out almost daily with the ore.

BRITISH COLUMBIA.

A GOOD COUNTRY TO PROSPECT IN.—Nelson Miner, Nov. 20: While it is yet too early to make any statements as to the extent or permanency of the ledges in the Sloan country, enough is known to warrant the Miner in stating that the country is one worthy the attention of both the prospector and the investor. The country is large, unprospected, and has every appearance of being a mineral one; it will be easily accessible in the spring both from Kootenay lake and from Nelson; the ore is of a

character easily treated, and of a grade that will stand shipment to the United States, if there should be no home market; it is not a claim country, as enough locations have already been made to give investors a chance to select a "winner." Although discovered after the first fall of snow, fully a hundred prospectors and miners have paid it a visit, and they all return with similar reports, that is, that the country is a good one and has a future. The formation is limestone and schistose shale; the gangue, dolomite and quartz. The vein matter carries a good percentage of iron. The ore is galena and carbonates and assays from a few dollars to hundreds of dollars per ton in silver; it is free from refractory elements. From the lay of the ground many of the claims can be easily developed by tunnels, and little machinery will be needed for the first year or two. There is an abundance of timber, much of it white pine. Eligible sites for reduction works are not lacking. In fact the country has nearly all the natural advantages that are looked for by mining speculators, without whom no new country can be speedily developed, however rich.

DAKOTA.

THE D. AND D. SMELTER.—Deadwood Pioneer, Nov. 24: Refining furnaces from Fraser & Chalmers came in Saturday, and will be placed in position at once. A new blast furnace and a new blower have been added to the plant. There is considerable misunderstanding about the shutting down of the plant. It has never been wholly closed down. The crushers and sampling works have never been closed for a moment. There are and have always been at least 12 teams constantly at work hauling ore, pyrites and limestone, in addition to that delivered by the D. C. railroad, the control of which belongs to the owners of the smelter. A large contract for the copper-bearing pyrite has been made with Utah mine owners, the first shipment of which is in transition. The all important question, why is the plant not in blast, remains unanswered. In answer to the reporter, the superintendent, Dr. Carpenter, said that he thought that the reason which would most readily occur to any one would be that given by the Pioneer, that the process is in some way unsatisfactory, but that the next run would decide the matter definitely. In our opinion, the reason is that one furnace alone could not be made to pay—could not compete with outside smelters. That it is not so much a metallurgical problem as one of competition. We understand that the owners of the smelter have already invested in the plant and purchase of ores about \$200,000, and expect to increase the amount to half a million when in full operation. The larger the plant and greater the facilities, the lower will be the rates for treatment. The mills and hoists of the Homestake and associate companies are good illustrations. The low-grade ores of the belt could not be successfully treated with a 20-stamp mill, neither can the refractory or silicious ores of Ruby and Bald Mountain be successfully treated with a one-stock smelter.

IDAHO.

EVOLUTION DISTRICT.—Wardner News, Nov. 28: Without any booming or extra flourish of trumpets, Evolution district is rapidly coming to the front as one of the most promising mining sections in the Coeur d'Alenes. Col. J. H. Davey & Son have taken charge of the Argentine mine, and are rebuilding the tramway, ore bins, etc., preparatory to shipping. There are in sight at present on this property between 15,000 and 20,000 tons of ore ready to break, and the mine is in good condition to commence operations. A sale of 10,000 tons has been already contracted for, and the owners expect to be ready to ship by December 1st. The mine is opened to a depth of 340 feet containing three levels, and a force of 30 men is kept constantly employed.

BULLION.—De Lamar Nugget, Nov. 24: The semi-monthly shipment of bullion made by the De Lamar Co. last week amounted to 9074 ounces, valued at \$4,454.72. This is slightly below the amount usually shipped in the middle of the month, the falling off being accounted for by two days' stoppage of the mill while shifting the power to the new engine. Work is progressing rapidly on the mill extension, the additional pans and settlers being all in place. In a few days more the capacity will be increased.

MONTANA.

HELENA MINES.—Helena Journal, Nov. 25: That the gold belt south of Helena is attracting attention is fully evidenced by the fact that the district is almost daily visited by representatives of mine operators, who are ever ready to investigate a mining proposition, regardless of its locality or past history. Such a one visited the properties yesterday, upon his return expressing his surprise that more active development work was not in progress. He stated that he considered the old Union more promising than when the pick of the discoverer brought to light the first piece of gold-bearing quartz. The present conditions for the economical working of the ore being so advantageous, compared to those existing when the property opened, insure immense profits where formerly fair pay only could be expected. The mountain of ore being worked by John Winscott through his ten-stamp mill on Big Indian Gulch proved to him a veritable revelation. "Why," said he, "a hundred-stamp mill could not reduce the ore in sight within a generation; and this is the feeling the situation inspires in a man who has visited every known mining district in America."

ANACONDA.—Butte Bystander, Nov. 21: The shipments of ore from the Anaconda properties has been increased to about 110 cars daily, which will amount to about 3300 tons. This is about the capacity of the lower works. Men are employed on the upper works getting them in order, and gradually the output of ore will be increased until a sufficient supply has accumulated to operate the whole plant. The company has sufficient coal on hand to warrant operating both works, and all that is lacking is the ore. Men are being employed at the mines here every day. The Wake-Up-Jim will soon begin to add its output of ore to that of the other mines, and before New Year's the output will probably reach 5000 tons daily. The operations of these great properties is already being felt not only in Butte, but in Missoula and the Bitter Root

Valley; at Elliston, at Rock Springs, Wyoming, and in fact all over the West, and its continued operation will swell next year the output of the mines of Montana several millions.

Mining Share Market.

The Comstock mining shares the past week hung around up to Monday at about the closing prices given in our last week's review, when they began to shade off under more active manipulation for lower prices through cross orders. The reported inside bear broker made another raid on the North End shares, which naturally affected the entire list and enabled quiet buying, by other brokers for the pools, of shares thrown out by outsiders. There is everything to warrant the assertion that the pools are taking advantage of the rough developments in the suit of M. W. Fox against the directors of the Hale and Norcross mining company, to frighten outside holders of the shares in the different mines to sell, and to do this more successfully, they continue to throw bombs (assessments) so as to make a complete and thorough scare.

The developments in the suit against the directors of the Hale and Norcross will most unquestionably be of the greatest possible advantage to the share market, and dealers will realize that fact before they are nine months older. The mines will, in the future, have to be worked according to the mining corporation laws of California, which means dividends and not assessments; and the pools, realizing this fact, have been and are still quietly picking up stocks, and the lower they can buy, the better for their purposes, but to get still more, it is morally certain that they will be compelled soon to enter the market as active buyers, and bid up for stocks and then outsiders, if they desire, can sell at a large profit.

The expose in the Hale and Norcross suit is raising the question if the directors of the company are not liable to criminal prosecution. It now looks as if they had been, to put it mildly, criminally negligent in their official capacity. Others outside of the officials, it now looks, have made themselves liable to prosecution, which may land them behind iron bars.

It is said by well-informed miners that news from the Comstock mines is being systematically suppressed, so as to help the pools to buy up the shares at low prices, but notwithstanding this, we are in position to affirm that the mines never before looked so promising as the work of developing the various levels proceeds. In last month a rich strike to the west was made in one of the Gold Hill mines, which undoubtedly brought about the break in prices. The strike was not looked for so soon by the pool at that end. In Belcher they are developing on the 200 and 300-foot levels a west ledge 40 to 45 feet wide, which is good to high-grade ore. In 1889, in the same mine, they ran into a four-foot ledge of rich ore on the 1100-ft. level, which was found to be 40 feet wide on the 1200-foot level and assayed up to \$50 a ton. Since then a mysterious silence has been maintained regarding this important find. In Crown Point and Yellow Jacket important development work has been and is being made; the same remark applies to Confidence and Challenge. A mysterious silence is still maintained regarding the rich strike officially reported last year by the Superintendent of Con. Imperial. The find was near the Alpha line and officially given at 10 feet wide, and assaying from \$30 to \$40 a ton. Since then the stock has been unduly depressed and regularly assessed. Is it not about time for officials to report the ore found in running the Ward shaft? The west drift on the 1800-foot Ward shaft was started for the purpose of striking the rich ore found several years ago in Potosi on the 2400-foot level, and from which the water drove them out. In Savage and Hale and Norcross active development work is under way; both mines should be paying dividends, as should Gould and Curry. Important news is expected to be received any day from the work now being pushed in the North End mines.

From the outside mines, our advice report that in the Quijota district the Peer and Peerless will start up next week on ore assaying about \$40 a ton, and as the ore is ready for crushing, and no expenses to be incurred, dividends are to be in order. Several of the Tuscarora mines are shipping high-grade ore to Salt Lake for milling. Dividends are confidently looked for soon. Coptis in that district continues to pay dividends. In Bodie district they will shortly start up the mill on the accumulated ore now on the dump and in the mine ready for shipping. Both Bodie and Bulwer have large quantities of rich ore on the dump. The mines in the Candelaria district have shut down. Miners asked too much wages.

The Comstock mining shares act as if they will touch the low prices by Saturday that insiders said some time ago they had to come down to.

The following law is interesting reading, and may prove quite expensive to those brokers who have been evading it:

Section 587, Civil Code, Sec. 2, of an Act for further protection of stock in mining companies:

All stock in each and every mining corporation in this State shall stand in the books of said company in all cases in the names of the real owners of such stock, or in the name of the trustees of such real owners; but in every case where such stock shall stand in the name of a trustee, the party for whom he holds such stock in trust shall be designated upon said books and also in the body of the certificate of such stock.

A movement is on foot to oust the Levy-Harmon combination from the management of the Savage Mining Co., which will be followed by throwing them out of the Hale & Norcross management. Let the good work extend to all the mines on the Comstock run in the interest of the mill ring.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING NOV. 24, 1891.

- 463,943.—POTATO DIGGER—J. W. Cook, Jefferson, Or.
- 463,791.—WATER TANK—F. X. Fischer, Oakland, Cal.
- 463,792.—WATER-WHEEL—Walter Galbraith, Santa Cruz, Cal.
- 463,964.—BASKET—C. E. Gates, Oakland, Cal.
- 463,727.—RAILWAY SWITCH—A. M. Grubbs, Forest Grove, Or.
- 463,728.—RAILWAY FROG—A. M. Grubbs, Forest Grove, Or.
- 462,902.—FEEDER FOR HEATERS—Wm. Jones, La Grande, Or.
- 463,912.—MINER'S TOOL—R. A. McVitty, Snohomish, Wash.
- 463,795.—DIRT-SCRAPER—D. F. Oliver, Oakland, Cal.
- 463,869.—DUMPING CAR—C. D. Page, Tacoma, Wash.
- 463,966.—AGRICULTURAL MACHINE—J. E. Reed, Los Angeles, Cal.
- 463,649.—BUILDING MATERIAL—J. O. Rollins, Forest Ranch, Cal.
- 463,875.—PROCESS—A. Sommer, Berkeley, Cal.
- 463,997.—PRINTING PRESS—H. Swain, S. F.
- 463,927.—FIGURE TOY—G. Y. S. Wada, S. F.

The following brief list by telegraph, for Dec. 1, will appear more complete on receipt of mail advices:

California—William J. Brennon and C. A. Pitcher, Needles, sheep and boiler cleaner; Joseph Craig, Woodland, fruit; Anson W. Delane, San Diego, device for packing fruit; San Francisco, rock drill; Adam Heberer, Alameda, furnace for steam boilers; David G. McFar, Santa Ana, fruit-gatherer; Max Meyerberg, Los Angeles, chandelier display hanger; Joseph Pettibon, Oakland, dust guard for car axle boxes; Hadwen Swain, San Francisco, printing press; Myron K. Gibson, Ukiah, bicycle. Oregon—John B. Mahana, Froewater, method of and apparatus for the propulsion of trains. Nevada—William A. Hawthorne, Carson City, support for beehives.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WATER TANK.—Frank X. Fischer, Oakland. No. 463,791. Dated Nov. 24, 1891. The object of this invention is to provide for keeping the joints of liquid tanks tight under all circumstances. It consists in a channel formed with or secured to the upper portion of the tank, said channel being adapted to receive and hold liquid, which, by absorption, passes into the pores of the wood and keeps it moist, thereby preventing shrinkage. Water tanks are generally made of staves bound together by hoops. When the tank is full, the wood swells and the joints become tight, but when the staves become dry, as they do when the water in the tank is low, the wood shrinks and the joints open. The tank will then leak. This shrinkage is of permanent disadvantage to the tank and requires frequent attention and driving down of the hoops. This difficulty is specially noticeable in climates where there is a long season of drouth and calms, attended with heat, especially in the interior of this State. The water in the tanks gets low and the whole upper portion shrinks and permanently injures the tank. There being but little wind to operate the mill, it is impossible to keep the tank full, but by keeping water in the channel it will soak into the wood and keep it moist. There is generally enough wind to raise some water frequently. Now, by introducing this water to the tank through the intervention of a suitable channel at the upper portion, the water will not only soak into the wood, but the surplus can be directed downward upon the inner surface of the tank, thereby keeping it wet and preventing shrinkage. Therefore, whether the tank be full or not, its joints will always be tight and the life of the tank will be considerably extended.

WATER-WHEEL.—Walter Galbraith, Santa Cruz. No. 463,792. Dated Nov. 24, 1891. This invention relates to improvements in water-wheels, in which the inventor seeks, first, by the arrangement of the step to avoid friction to the greatest possible extent; second, by the arrangement of the buckets to avoid interference with the water when applied to the wheel; third, by the shape of the buckets to utilize the greatest possible percentage of the force of the water; fourth, by a screw in conjunction with the step to make the wheel itself act as a gate, thus avoiding wear and tear from the effects of sand and rubbish; and fifth, by the simplicity of the combination of the wheel disk or shell and buckets to reduce to the smallest extent the loss from friction and the attrition of all substances that may be carried in the water. These objects the inventor claims to have attained by the construction described in the patent.

DIRT-SCRAPER.—D. F. Oliver, Oakland, assignor to Truman, Hooker & Co., S. F. No. 463,795. Dated Nov. 24, 1891. This is one of that class of dirt-scrappers in which a bowl provided with end runners and a rearwardly projecting handle is connected by pivoted links with a drag-bar, and is adapted to be turned over upon its runners to dump its load, said turning being limited by a suitable stop. The object of this invention is to provide a suitable and effective stop for this purpose, one which can be fixed at a certain point or can be rendered adjustable to vary the limits to which the bowl can turn, as may be desired.

THE Japanese earthquakes caused a loss of life of 7566 persons, and 10,121 were wounded. There were 89,629 buildings completely destroyed, and 28,628 damaged.

MECHANICAL PROGRESS.

Welding Tires.

A correspondent of the *Blacksmith and Wheelwright* gives some very valuable suggestions in regard to welding tires. He says there is no work which the jobbing blacksmith is called upon to perform that requires more care or skill than the welding and resetting of tires. In parts of the country in which the roads are dry and the heat of summer is high, the action of the heat is twofold; in the first place, it shrinks the felloes, and secondly, it expands the iron. In both ways, therefore, heat loosens the tire and makes resetting a necessity.

In the majority of shops, there is no such appliance as a tire-shrinker, and the tire must be cut and rewelded. It is difficult to understand why it is so, but the fact exists that in a majority of small shops there is a strong prejudice against that mode of shortening a tire, and the smiths are convinced many of his customers that the method is a bad one. This has made the introduction of this valuable adjunct almost impossible. The result is that welding must be resorted to, and many blacksmiths experience serious trouble in getting a good weld, even when, to all appearances it is all right.

The defect is generally at the outside point of the weld, on the head. The average tire, when welded, shows the outer point only partially joined. Sometimes it appears as if the point had been chilled and pounded down into, not welded to, the portion under it.

He gives an illustration which fully explains his method, but which we are unable to present. After properly measuring and placing the two ends for welding, they are first joined by a rivet, carefully and correctly placed in holes properly punched. After inserting and securing the rivet, reheat to a clear, red heat and rivet closely, taking care that the points are in their proper position. If a steel wire is used, apply a flux heat up to a welding heat, and with a wire brush, remove all flux and dirt of every kind before beginning to weld.

The face of the anvil needs looking to. Lack of care with regard to that causes much of the trouble met with in welding. Remember that the end of the piece to be welded is drawn down very thin, and it quickly cools below a welding heat when it is exposed to the air or comes in contact with a body colder than itself. If placed upon an anvil that has a cold face, the slight chill which results will prevent a perfect weld. Therefore, see that the face of the anvil has a temperature of at least 100 degrees, before the tire is placed on it for welding.

Having secured the proper heat and a perfectly clean surface, place the tire upon the anvil, and begin pounding at the lower portion of the weld, and work gradually up toward the other point. By working in this way, the welding is begun at the point where the iron is most likely to lose its malleability, and it works out the flux and any other foreign substances that may be between the plates. After making a perfect weld on the flat, turn and pound the edges before the welding heat is gone. If the tire is of steel or very thin iron, I do not recommend working the edges. A better way is to remove all surplus material with a cold chisel and a file. When all is tried up to the proper thickness and width, reheat and reduce to the proper shape, using a light hammer for the purpose.

The blacksmith who will follow this method closely, using a clean fire when making his heat, will find no difficulty in making a clean, strong and even weld, no matter whether the tire be heavy or light, iron or steel.

BALL BEARING FOR CABLE RAILWAYS.—The sheave bearings for cable railways are subjected to constant and heavy friction, particularly around curves, and requires an enormous power to merely run the cable alone, which is greatly increased when dozens of cars are operated. The present invention is designed to save a large portion of this power, and also avoid the wear which is always incident to friction. Mr. Clarence A. Burton of Kansas City, Kan., has adapted the mechanically popular ball bearing to the sheave journals in such manner, that particular exactness of adjustment is not required, and vastly simplifies as well as improves the working capacity and endurance of the parts. The bearing blocks within which the ball groove is formed are made in two sections, horizontally separable, the half circle groove being formed in each and conjointly forming the complete bearing channel. These blocks are externally rectangular and fit snugly into a box casing, which is formed with axial trunnions that are suitably engaged in any desired form of bracket support. A draw slide serves to close the bearing box and excludes all trash that may drop into the cable way. The upper bearing section being independently removable, the operation of putting in the balls is exceedingly simple. The lower half can be filled, the spindle placed, then the upper section laid on, and the rest of the balls dropped in an office communicating with the ball groove. This admirable invention, it is claimed, makes it practicable to use this most desirable style of bearing, which will give marked results in practice.

A NEW ALUMINUM BRONZE RESISTANCE METAL.—The Aluminum Brass and Bronze Company at Bridgeport, Conn., announce a new

resistance metal in wire, sheet or castings, which seems to be a very important contribution to this class of material in electrical engineering. The wire samples resemble ordinary copper wire on the outside, and have a pinkish white tinge at the surface of fracture. The wire is very strong, without losing much ductility. The torsion test shows over 80 twists in six inches for an annealed wire, which still possesses 70,000 lbs. tensile strength to the square inch. The hard drawn wire, it is said, runs to 100,000 lbs. tensile strength, with about 40 twists in six inches. Combined with these admirable mechanical qualities, it is claimed that the wire has the remarkable resistance of 35 times that of copper with a temperature coefficient of less than one-tenth of that of German silver; furthermore, the wire is cheap. We understand that, by having the resistance lower than in the samples described above, the tensile strength can be increased up to 140,000 lbs. per square inch. These particulars relate to wires .080 inch in diameter or thereabouts.

EFFECTS OF COLD ON NICKEL-STEEL.—The consequences of allotropic changes, which result in alteration of structure, are very great. The case of the tin regimental buttons which fell into a shapless heap when exposed to the rigorous winter at St. Petersburg is well known. The recent remarkable discovery by Hopkinson of the changes in the density of nickel-steel (containing 22 per cent of nickel), which are produced by cooling to -30° , affords another instance. This variety of steel, after being frozen, is readily magnetizable, although it was not so before; its density, however, is permanently reduced by no less than 2 per cent by the exposure to cold; and it is startling to contemplate the effect which would be produced by a visit to the arctic regions of a ship of war built in a temperate climate of ordinary steel and clad with some 3000 tons of nickel-steel armor; the shearing which would result from the expansion of the armor by exposure to cold would destroy the ship. Experimental compound armor plates have been made faced with 25 per cent nickel-steel, but it remains to be seen whether a similar though lessened effect would be produced on the steel containing 5 to 7 per cent of nickel, specially studied by J. Riley, the use of which is warmly advocated for defensive purposes. Farther information as to the molecular condition of nickel-steel has within the last few weeks been given by Mercadier, who has shown that alloying iron with 25 per cent of the nickel renders the metal isotropic.

ADHESION OF BELTS.—Recent discoveries have made it almost certain that the adhesion of belts to pulleys is as the square roots of the arcs of contact. This is of importance in that it simplifies the method of calculating the transmitting power of belts; enabling all by a short process of figuring to determine about what a belt may be capable of doing under varying degrees of contact. It can be assumed as a basis that the effect of 180 degrees contact is 100. Then as the square root of 180 is to 100 so is the square root of any other arc of contact in degrees to its effect. Or, to be more explicit, divide 100 by the square root of 180 and multiply the product by the square root of the given arc of contact, the result being the effect as compared with 100. In making calculations of that kind it is perfectly safe to assume that any good single belt will transmit 1-horse power for each inch in width, the arc of contact being 180 degrees, and the lineal speed of the belt 800 feet per minute. Briefly stated, then, the transmitting power of belts is directly as to their widths, lineal speeds, and as the square roots of their arcs of contact. The arc of contact being the same the adhesion is the same on all sizes of pulleys. That is, a 180 degree arc of contact on a 24-inch pulley is, other things being equal, in all respects equal to a like arc of contact on a 48-inch pulley, and the one will transmit no more power than the other if the lineal speed of the belt be the same in both cases.—*Exchange.*

CEMENT FOR IRON.—The following is given as a mixture for joining pieces of iron together: Equal parts of sulphur and white lead, with about one-sixth proportion of borax, and the three constituents of the mixture, and the three should be thoroughly incorporated together so as to form one homogeneous mass. When the composition is to be applied it should be wetted with strong sulphuric acid, and a thin layer of it placed between the two pieces of iron to be connected, these being at once pressed together. The *Chemical Trades Journal* says: "It is stated that the cement will hold so firmly as to resist the blows of a steam hammer, and dry so completely in a few days as to leave no trace of the cement, the work then presenting the appearance of welding."

A NOVEL MACHINE for piling lumber, the invention of W. S. Riddell, may be seen in Vance's lumber yard. It saves much labor and the men using it are loud in its praise.—*Eureka Times.*

THE TELEPHONE between London and Paris has been extended beyond the latter city to Brussels and also to Marseilles, the latter a distance of 900 miles, over which distance it works well.

The cost of smooth-bore cast iron guns ranged from \$125 to \$150 per ton; now our rifled steel breech-loading guns cost from \$850 to \$1000 per ton.

SCIENTIFIC PROGRESS.

Meteoric Studies From Scientific Kites.

The *American Meteorological Journal* for July contains an article on Franklin's kite experiment by A. McAdie. After giving various details respecting Franklin's experiments, the author describes similar experiments recently carried on at the Blue Hill Observatory, near Boston, the chief advance being that at every step the electrical potential of the atmosphere was measured by an electrometer. The kite was sent up on several days, and at a height of 1000 feet sparks over one-third inch in length were obtained, while abnormal movements of the stream of water from the electrometer during electrical disturbance always foretold when a flash of lightning was about to occur.—*Cloud Heights and Velocities at Blue Hill Observatory*, by H. H. Clayton. This paper contains the results of cloud observations made at Mr. A. L. Rotch's observatory during the last five years. The average heights of some of the principal clouds were—nimbus, 412 meters; cumulus (base), 1558 m.; false cirrus, 6500 m.; cirrostratus, 9,652 m.; cirrus, 10,135 m. The cumulus is highest at Blue Hill during the middle of the day. The Upsala observations show that the base of the cumulus, as well as the cirrus, increases in height until evening, but neither of these conclusions apply to the observations at Blue Hill. The average velocity found for the cirrus (82 miles an hour) is twice as great as that found at Upsala.

The extreme velocity was found to be 133 miles an hour. A comparison between wind and cloud velocity shows that below 500 meters the wind velocity is less than the cloud velocity. Above that, the excess of the cloud velocity increases up to 1000 meters, and then decreases again till about 1700 meters, after which it steadily increases. This decrease between 1000 and 1700 meters is very probably due to the fact that the clouds between 700 and 1000 meters were mostly observed during the morning, when the cumulus moves most rapidly, and that the clouds between 1000 and 1700 meters were mostly observed during the afternoon, when the cumulus moves slowest.—*Meteorological Kite-flying*, by W. A. Eddy. This is an account of some experiments made at Bergen Point, N. J., to determine the vertical extension of warm air currents by means of self-recording thermometers carried by a kite string. Experiments showed that an altitude of 1800 feet could be obtained by using one kite, and that many hundred feet could be added to the altitude by lifting the weight of slack string by fastening on larger kites. It is estimated that by this means an altitude of 4000 feet was obtained. The minimum temperature at an altitude of about 1500 feet, on February 14, last, was only two degrees lower than at the surface.

HOW THE ANCIENTS TELEGRAPHED.—Telegraphy was practiced by the ancient Greeks and Romans. One method was the placing in pots, straws or twigs, saturated with oil. They were placed in rows and expressed certain letters according to the order in which they were lighted. Another method was that invented by a Grecian general who flourished in the time of Aristotle, intended for communication between the generals of an army. It consisted of two exactly similar earthen vessels filled with water, each provided with a cock that would discharge an equal quantity of water in a given time, so that the whole or any part of the contents would escape in precisely the same period from both vessels. On the surface of each floated a piece of cork supporting an upright, marked off into divisions, each division having a certain sentence inscribed upon it. One of the vessels was placed at each station, and when either party desired to communicate, he lighted a torch which he held aloft until the other did the same as a sign that he was all attention. On the sender of the message lowering or extinguishing his torch, each party immediately opened the cock of his vessel, and so left it until the sender relighted his torch, when it was at once closed. The receiver then read the sentence on the division of the upright that was level with the mouth of the vessel, and which, if everything had been executed with exactness, corresponded with that of the sender and so conveyed the desired information.

PREVENTION OF COAL-DUST EXPLOSIONS.—A German paper describes a new device, which has been found sufficiently successful to warrant its introduction into several German mines for the prevention of coal-dust explosions. The usual method of sprinkling water in dusty parts of the mine has only a limited value, as the dust is generated by the breaking down of the coal, and explosions may occur from the liberation of gases at the same instant. To meet such cases, the use of water has been given an entirely new application, the effect of which was somewhat a surprise at the first experiment. Holes one meter deep are drilled in a distance from each other of about three meters, wooden plugs are inserted, and through them iron pipes from three-quarters to one meter long, with openings between 2½ and three millimeters large, and connected with rubber hose. In the Camphausen colliery a pressure of from 8 to 10 atmospheres and injection through two tubes in eight hours proved sufficient to impregnate 61x1½ meters. In the Kreuzgraben colliery the water forced in under a pressure of

20 atmospheres during 16 hours moistened thoroughly the coal as far as four meters above the highest hole. Of importance for the successful application of this method are the water pressure obtainable, the quantity of water injected, and the firmness of the seam, the last item depending to some extent on the size of the coal pillars in the workings.

WHAT A MODERN GUN CAN DO.—Unless one is actually brought into business relations with the great science of modern warfare, says the *Boston Traveler*, it is difficult to conceive of the terrible power of the latest and largest guns. These engines of destruction, weighing 110 tons, hurl a projectile of solid steel 16 inches in diameter and nearly 4 feet long at a velocity of 2079 feet a second. When tested recently, one of these guns sent a shot through 20 inches of steel armor, 8 inches of iron, 20 feet of oak, 5 feet of granite, 11 feet of concrete and 3 feet of bunk. Comparatively, a locomotive weighing 200,000 pounds would have to spin along the tracks at a rate of 135 miles an hour to strike a blow equal to that projectile. Think of the damage wrought in a railroad collision where the train speeds along at the rate of 30 miles an hour, and one may estimate the destructiveness of modern ordnance.

HOW TO PRESERVE PLANTS FOR A BOTANICAL CABINET.—This question is answered by the "Scientific American Encyclopedia" as follows: The method consists in dusting salicylic acid on the plants as they lie in the press, and removing it again with a brush when the flowers are dry. Red colors in particular are well preserved by this agent. Another method of applying the same preservative is to use a solution of one part of salicylic acid in 14 per cent of alcohol by means of blotting paper or cotton soaked in it and placed above and below the flowers. Powdered boracic acid yields nearly as good results. The *Gardeners' Chronicle* recommends as an improvement in the method of using sulphurous acid for preserving the color, that in the case of delicate flowers they might be placed loosely between sheets of vegetable parchment before immersion in the liquid so as to preserve their natural form.

ELECTRIC COLOR TEST OF GEMS.—In pursuing his researches on the phosphorescence of gems under the electric discharge in a high vacuum, a scientist has found the light evolved to be of different colors, according to the origin of the stone. Diamonds from the Cape show a blue phosphorescence, those from Brazil a red, orange, blue or yellow, and those from Australia a yellow, blue or green light. Crystalline alumina—that is to say, the ruby, sapphire and corundum—phosphoresces a deep red, and give a spectrum of one or more lines. Yellow sapphire glows with a delicate lilac tint. Uncut specimens of phenakites become yellow and blue under the discharge, while green emerald from Ireland emits a deep red luster, similar to that of the ruby, but does not give the ormeon spectrum of that crystal.

AN AMERICAN SYSTEM OF EDUCATION.—Prof. Jordan of the Stanford University recently gave a very interesting lecture before the Unitarian Club of this city, on the "Methods of Education," in which he compared the educational institutes of the Old World with the New, and followed the student through the several stages of thought and development incident to a collegiate course.

"There is," said he, a general American system of higher education being developed, which will prove vastly superior to any now in vogue. Its growth is necessarily slow, but always appreciable, and while years will be required for its perfection and full development, the time will come when the older nations will take pattern after a system of education which has had its foundation in America."

THE PILGRIM FATHERS would be wonderfully astonished were they to rise from their Plymouth graves and witness the wonderful revolution which has been accomplished, since their landing, in science and the industrial arts; but it is a question whether they would be more astonished at the locomotive, the telephone and the steamship than at the revolution in religious opinions which have occurred in these latter days.

THE AURORAL LIGHT.—The theory of the light of the aurora borealis was evolved from the analysis of its light by the spectroscope, which showed that it was caused by electrical discharges among the particles of meteoric dust in the atmosphere. The broad red line of the spectrum of iron is shown in all these cases, and thus upholds the theory, as it is well known that the principal part of meteors is metal.

A NEW USE OF THE ELECTRIC LIGHT.—By means of electric light, a lot of tropical plants imported last winter for the Kew Gardens, London, were kept in health below deck during the voyage—when without this light they would be perished; since on deck in the sunlight the cold would have been fatal.

A NEW FRENCH INVENTION is a chloro-chromic battery which can be used on miners' lamps in connection with an incandescent lamp. It gives more light, weighs about the same as the oil lamp, and will not explode.

ELECTRICITY.

Electricity As It Is and May Be.

Electricity is working revolutions in almost every department of science, industry and commerce. The marvelous transformations which are being wrought throughout the civilized world by this new and wonderful agent is the marvel of the ages. Nothing like it has ever before been seen. The introduction and history of steam is tame when compared with it.

Electricity touches life and industry at every possible point, modifying, transforming and extending all previous methods and practices. It has already annihilated time and space. It will put a girdle around the earth in the smallest fraction of a minute. It connects the earth with the sun in an almost meaningless minimum of time. With all its wonderful and almost irresistible power, it is quite as ethereal as light itself, and we are fast finding out that it can be mastered, controlled and rendered as harmless as the most innocent thing in nature. Regarding it in all its known conditions in relation to time, space and force, may we not regard it as the means of differentiating; as the connecting link indeed between the material and the immaterial world?

All of this and more, especially when we consider that we have the fullest reason to believe that the immediate future bids fair to transcend all the realization of the past. From a mere toy, electricity has, within half a lifetime, made all of this advance. In regard to the future, it is quite as fresh to say "We shall not," as to say "We shall."

The Long-Distance Telephone.

Nothing, perhaps, in electrical progress, exceeds the history of the telephone. Its introduction marks an epoch. At first we knew it as a means of speaking only from room to room. It next passed out into the street, then along the suburban wayside to an adjoining town. Then it halted for a time. Gradually, long-distance telephoning became the dream of the scientist and inventor.

At first its voice was weak and almost inarticulate, even when the distance was recorded in rods. The scientist and the inventor kept steadily at work until we got the microphone transmitter, which was soon followed by the induction coil and other important accessories and assimilating elements, until we now have the long-distance telephone very nearly or quite fully developed. Continuents may now be traversed with, perhaps, relays at long distances, and there is good reason to believe that they might even now be fully traversed by more expensive appliances than economy would, just at this time, warrant. In fact, arrangements are even now being made to telephone across the Atlantic. That the experiment will be successful, who that knows, can doubt? The tick of a watch can now be heard by the submerged wire between Dover and Calais, and the telephone between London and Paris is proving a big success, scientifically, commercially and financially. Electricians say there is no telephone circuit in London, or in England that works so clearly and perfectly.

The telephone will soon become as important to international commerce as it now is to that between town and town, although we have as yet reached only the mere fringe of telephony, as will be fully seen when ultimate development has been reached.

SOME FOREIGN THOMSON HUSTON WATER POWER PLANTS.—At St. Brieux, Cotes du Nord, France, two 1300-light Thomson-Houston alternators are driven by two Hercules turbines of the vertical type, one of 125-horse power, and the other of 150-horse power. An interesting characteristic of this plant is, that the two alternators are run in multiple upon the same circuits. The distance from the central station to the center of distribution is 8.4 miles, and the pressure employed is 2000 volts. It is interesting to note that the wire employed to convey the current for 2600 16 candle power incandescent lamps 8.4 miles is in this case only .31 inch in diameter. At Guatemala, Central America, a combined arc and incandescent plant has been operated by means of water power since 1887. A part of the plant, consisting of two A-70 1300-light alternators, is 3½ miles distant from the city. The dynamos are driven by a countershaft from the 21-inch Rodney Hunt turbine of 250-horse power. Three 18-light arc dynamos are 7½ miles away from the city. The city of Puebla, Mexico, possesses an electric lighting plant which is in many ways remarkable. Two hundred arc lamps of 1200-candle power are run by four 50-light arc dynamos, in a station about 13 miles from the center of the town, where the river Atoyac furnishes power for a 200-horse power Leffel double turbine. Each of the four circuits is about 26 miles in length, and consists of a No. 4 insulated wire. The dam and all the masonry connected with the station itself is built of fine cut stone, forming, probably, one of the most substantial and best built structures in Mexico. As the station is so far from the town, and in the midst of a country infested with bandits, the Government finds it necessary to maintain at all times a guard, consisting of seven soldiers, to protect the station from injury by marauders.

ELECTRICAL APPLIANCES appear to be rapidly extending in every direction and for the most varied purposes.

A contract has been entered into between the Niagara Power Co. and an electric company in Buffalo, by which the latter will utilize 20,000-horse power, which will be distributed throughout the city of Buffalo, for all ordinary power purposes.

The rapid transit commission of New York has completed its labors and presented its report. The engineer of the commission expresses the belief that electricity will be the power adopted, although it is not expressly specified in the report.

An immense electric plant is to be placed in position at the Peorran mine in Burke, Montana. Seven carloads of machinery are already on the ground, at last reports, and two more loads will be required to complete the plant. All power in connection with the immense works will be supplied by it. One of the dynamos is 225-horse power, the largest west of the Mississippi river. They will have 450-horse power, 225-horse power now operating their concentrator, hoist, etc. Daniel Thiery is in charge of the work, assisted by that able electrician, Harry Goodwin. The power to operate this plant is supplied by water, a fall of 760 feet, or 430 pound pressure, being secured.

The Morgan mine of Nevada is to have a 50-light accumulator plant, to be supplied by the Pacific Electric Storage Co. of this city.

There are now orders out for a large number of Electric lighting plants in this city.

OBJECTIONS TO ELECTRIC MOTORS IN COLLIERIES.—Prof. S. P. Thompson states that there are two points to which colliery managers are likely to raise objections in the use of electric motors in pits. The first of these is the possibility of gas explosion being caused by a spark occurring at the commutator of the motor where the electric current is conveyed into and out of the rotating armature by means of the brushes. The second is the use, in the pit, of driving belts, which not only take up space, but cannot be kept in good working order in dirty and damp situations. The commutator difficulty is, he believes, largely an imaginary one. No doubt, in many dynamos and motors, a bright bluish spark may occasionally be observed at the tips of the brushes, especially if the latter are not in proper adjustment. In well designed machines of modern construction, the spark is practically non-existent under ordinary conditions of working. The question raised is whether it affords any real danger. The spark is so close to a large mass of copper that it is practically cool; so cool, indeed, that it is extremely difficult to cause it to ignite anything.

THE LARGEST ELECTRIC LOCOMOTIVE EVER BUILT is said to be the one now being used by the Lonsdale Co. at its extensive cotton mills in Lonsdale, R. I. It consists of a platform car and trucks having a 30 horse power motor, with a trolley stand at one end, and at each end controlling devices, so that the locomotive may be moved both forward and backward. The locomotive is capable of hauling 60,000 pounds, and goods may be also placed on the platform of the locomotive itself. The length of the track over which the machine runs is 2700 feet. Electricity is supplied from a 500-volt dynamo having a capacity of 30,000 volts, and this is operated by a water-wheel. This renders the cost of operation very inexpensive, while a large amount of time and energy is saved in shipping goods from one part of the establishment to another.

THE ELECTRIC LIGHT AN AID TO DENTISTRY. Dr. Prunyn, a dental authority of note, says that he finds that by electric light dentists can find imperfections in cavities prepared for filling, that escape notice under a different light. This is particularly the case with the form of decay known as the white decay. You may prepare the cavity with the ordinary care, having it perfectly dry, seemingly, a magnifier, even, showing you no imperfections, but with the aid of this pale, white, electric light, more intense than daylight, you will find imperfections.

PAPERS ON ELECTRICITY.—Mr. Geo. P. Low, an electrical expert of this city, has commenced a series of papers to be read before the members of the California Electrical Society. His first paper was on the "Hazards of Electric Light and Power Circuits," in which he entered upon a general discussion of the elementary principles involved. The papers will be continued at every regular meeting of the society.

ELECTRIC MOTORS are not in as general use in England as in this country on account of the low price of gas there. A horse power can be generated in London by a gas engine for less than two cents per hour, whereas electricity costs more than twice that amount.

THE ELECTRIC WELDING OF RAILWAY BARS has reached an ultimate and really practical success in regard to bars, switches and crossings. Moreover, the welding has been proven more uniform and stronger than can be reached by any other method.

The first electric telegraph at all deserving the name was invented by Messrs. Cooke and Wheatstone, and was laid on the London & Blackwell Railway in June, 1837.

USEFUL INFORMATION.

Wood Pulp.

Wood pulp is fast becoming an industry of large proportions. A contemporary says:

Wood fiber has come into general use as a substitute for cotton rags and other materials formerly employed in the making of paper. This fiber is called pulp, having taken the name which used to be given to the cotton and linen fiber when it had been prepared by maceration for spreading into sheets of paper. The wood fiber used to be prepared, only a few years ago, by a wholly mechanical process. The blocks of wood were ground or rasped off by action applied obliquely to the grain, the length of fiber dependent partly upon the angle at which the block was held during this process.

In place of the old mode of obtaining wood pulp, chemical treatment of the wood is now in vogue. As formerly, the bark is stripped from the wood to secure fiber of uniform quality. All discolored or decayed parts are removed for the same reason. Then the wood is cut across the grain into thin chips, which are carried to the top of the mill and dropped into large drums about 14 feet in diameter and 24 feet long.

The drums are made strong enough to bear a pressure of from 75 to 200 pounds to the square inch. When a drum is packed full of chips, it is filled with sulphuric acid and other chemicals. The wood is converted into a cotton-like product, which is then pressed dry and washed. It is next mixed with water, rolled flat and cut into shape for bundling. In this condition it is said to be made up of 60 per cent moisture and 40 per cent fiber. In this shape it goes to the paper mill. It is found to be better to pay the freight on the contained water than to cheapen the cost of transportation by pressing out the water, for the pulp packs hard when it is dry.

One cord of spruce wood is estimated to make 1200 pounds of dry fiber, worth from \$1 to \$1.50 a hundred pounds. A sulphite plant that will use up from 8 to 15 cords of wood every 24 hours costs about \$10,000.

EVOLUTION OF THE KNIFE.—"This case full of implements which we have newly placed on exhibition is designed to show the development of the tool which we call the knife, beginning with the earliest times," said Prof. Meson at the National Museum to a Washington Star reporter. "First, you observe, is the fragment of flint which the savage split by banging it on top with a stone hammer into a number of flakes. The smaller ones were used for arrow points and the larger ones for knives, their edges being split off so sharp that you might almost shave with some of them. Next you see the flint flake inserted into a handle of split-wood or bone, and as further improvements, the fastening of this primitive knife in the handle by the resin of trees and by cord of one sort or another bound around to secure it. The most beautiful knife in the collection is the exquisitely molded blade of greenish shade belonging to the stone age, handled with a walrus tusk. You can hardly find a more admirably formed weapon among the best products of modern toolery wares. Most curious of the modern tools here is the sailor's knife, square at the end instead of pointed, to prevent stabbing in a row or the dangerous falling of the weapon from aloft. Its blade drops out at the end of the handle when a catch is touched, so that Jack can hold a rope with one hand and open the knife for service without the need of ten fingers."

INCREASING USE OF COPPER.—At present, the American Bell Telephone Co. of Boston has under way 50 lines of long-distance telephone construction from Chicago to New York. Each of these 50 lines takes two lines of wire, making 100 lines of single wire, and as the distance from New York to Chicago is about 980 miles, the length of wire used in connecting these two points would be 98,000 miles of wire. The size of the copper wire used in the construction of the long-distance telephone weighs 174 pounds to the mile, making the total weight of copper turned into wire for this one undertaking 17,052,000 pounds, or 8526 tons; or 3,000,000 pounds more than the total production of the Tamarack for the last year; or within about 1,800,000 pounds of the combined output of the Quincy, Osceola and Franklin, or, omitting the Calumet and Hecla, Tamarack and Quincy, more copper than the remaining combined Lake Superior copper mines produced in 1890.—*Mining Gazette.*

A GOOD HORSESHOER IS BORN, NOT MADE.—"Nay, lad, I'll have a great patience with you. Before many days are over, make the shoe you may, and make it well; but to shoe a horse as the horse ought to be shod, that comes by God's grace."—*George MacDonald.*

A **BLOTTER** can be made that will remove ink spots from paper. Take a thick blotting paper and steep it several times in a solution of oxalic acid or oxalate of potassium. While the ink spot is still moist apply the prepared blotter, and the ink will be entirely removed.

A **DOCUMENT** envelope that works like a telescope, adjusting itself to one paper or to fifty, is a recent invention.

GOOD HEALTH.

GLUE IN SURGERY.—In some of the surgical clinics in Germany, there is now employed a glue for holding dressings in place—designed to be used in all those cases where elastic collodion and solutions of rubber are found so convenient, especially in holding dressings over fractures, while at the same time permitting free motion of the parts. It has the advantage of not cracking or breaking, of holding firmly, of being very pliable, allowing a great amount of motion, and, lastly, of not preventing the exercise of the function of the skin over which it is placed, so that there does not occur any peeling off of the upper layers of epithelium with a tendency to eczema. This glue is composed of glycerine, gelatine and water, of each 30 parts, and 10 parts of oxide of zinc, this making what is known as the thick paste; the thin paste has 30 parts glycerine, 20 parts gelatine, 40 parts water and 10 parts zinc oxide; the mixing of these elements is of course done over heat, and the paste is liquefied over a water bath when needed. When ready to apply, the part is well dried with a brush, a ring made round the part to be enclosed, and the gaze of the dressing then laid on, care being taken to have the pieces cut large enough to allow the edges to extend into the ring of paste already laid on. Over this is placed a single or double layer of gauzes, cut somewhat larger; the whole is now painted over with the paste, and the dressing is finally dabbed over with a hunch of cotton held in the hand.

CORNS NEED ABSOLUTE REST.—An absolute and permanent remedy for corns is the rest cure, says a New York Times writer. If you can go into a fortnight's seclusion giving out that your ankle is sprained, and keep the corn foot in a stocking and wool bedside slipper, without pressure, and using only when walking about the room, the corns will disappear and will not return. All inflammation subsides first and the corn becomes loose and easily detached, and that is the end of it. For soft corns the constant wearing of a bit of old linen saturated every morning with sweet oil is said to be a sure cure. From the beginning the pain of the inflammation ceases, and after a time the corn itself loosens and falls out. Both these remedies are from good authority and will bear trial, the first one, perhaps, being rather difficult of accomplishment, since many of the acids and corn salves sold, irritate and produce soreness and the knife of the chiro-podist is apt to afford merely temporary relief.

CURIOUS CASE OF COLOR BLINDNESS.—The London *Lancet* publishes a curious case of color blindness. The patient was an engine driver in Russia, about 40 years of age, whose vision was perfect until 1889. Then he began to suffer from violent headaches, due to over exertion and insufficient sleep, which were followed by a loss of all power to distinguish colors. Everything appeared to him to be red, and he was obliged to throw up his position. Dr. M. Reich, who examined him, could discover no disease, but found his sight, focus and sensation of light, normal. In May, 1890, the man again submitted himself for examination, declaring that his sense of color had been restored. This proved to be the fact. The *Lancet* thinks that "this case seems to show that sensation of color is perfectly independent of physiological function."

CRAMP IN THE LEG.—Many persons of both sexes are greatly troubled with cramps in one or both of their legs. It comes on suddenly, and is very severe. Most people jump out of bed—it nearly always comes on just after going to bed or while undressing—and ask some one to rub the leg. There is nothing easier than to overcome the spasm. Provide a good, strong cord—a long garter will do if nothing else is handy. When the cramp comes on take the cord, wind it round the leg over the place that is cramped, and take an end in each hand and give it a sharp pull—one that will hurt a little. The cramp will instantly cease, and the sufferer can go to bed assured that it will not come again that night.

MENTHOL OR SALICYLLATE OF SODA.—Menthol is strongly recommended to relieve itching of whatever nature it may be. It has the greatest effect in cases where scratching provokes soreness. This is said to be particularly true of nettle rash, certain eczemas, and the pruritus following scabies, if the itchy mites have been destroyed. The experience of the writer is to the effect that a solution of salicyllate of soda is the best remedy for the above-named troubles. Either are good and their virtues should be more generally known.

ASTHMA. It is stated, may be greatly relieved by soaking blotting or tissue paper in strong saltpeter water; dry it, then burn it at night in the sleeping-room.

MIND AND MATTER.—"What is mind?" asked an inquirer of a scientific friend. "No matter," was the laconic answer. "What is matter?" continued the questioner. "Never mind," replied his scientific friend.

CALIFORNIA VINEYARDS.—One of the telegraphic rumors is that an Englishman is now on the way to buy up the vineyards of California.

Passing Events.

The proceedings of the miners' convention at Auburn, Placer county, published in another column of the PRESS, shows that at least the miners have made up their minds to permanently organize and bring their many grievances to the attention of the public.

A state miners' convention has been called for Jan. 20th, when representatives from all the counties of the State are expected to meet, in order to bring to the attention of Congress the condition of the mining industry in this State, and the measures required to put it on a proper basis.

The revelations in the case of the Hale and Norcross, just now on trial in this city, shows a very bad state of affairs in connection with Comstock mining interests. A new deal in management all round would be a very good thing for that section.

The fact that capital is seeking investment in the hydraulic mines of Siskiyou county (as shown in our Mining Summary) indicates that the Legislature was wise in permitting the miners to use the Klamath river for their tailings. That section of the State will doubtless reap permanent benefit from the mining operations.

The Miners' Convention at Auburn.

On Saturday last, pursuant to call, the miners of Placer county met at Auburn to organize a permanent miners' association, and issue a call for a State Convention to take place in San Francisco, January 20th. A very earnest body of practical miners came together at this meeting, and the proceedings were of a temperate, conservative character, while at the same time it was evident that all were anxious in presenting the true condition of the mining industry of this State to the public.

The Hon. J. H. Neff of Colfax presided, and Committees on Credentials, Order of Business, Permanent Organization and Resolutions were appointed. A recess being taken, to give them time to report. On reassembling, the Committee on Permanent Organization and Order of Business, through Wm. Nichols, Jr., reported: Hon. J. H. Neff of Colfax for chairman; John Spaulding of Auburn, T. B. Harper of Lincoln and H. V. Martin of Towles for vice-chairmen; Hon. J. A. Fischer, secretary, T. B. Everett, Cor. secretary; W. W. Rodenhaver, Fin. secretary.

The Committee on Resolutions being called on, reported through its Chairman, Hon. J. A. Filcher, as follows:

WHEREAS, The apparent conflict of interest between the mining and agricultural industries of California, in reference to the subject of hydraulic mining, has resulted in the confiscation of property rights and of the almost total annihilation of a great industry on the one hand, and in "hard times," financial stagnation and bankruptcy on the other, and

Whereas, A conflict, which can only result in disaster to both of these interests, may be adjusted by a wise and conservative harmonizing of the interests affected; and

Whereas, The Governor of the State of California has called attention to the great importance of the solution of the mining problem; and

Whereas, By a complete restoration of the gold industry of California, the gold output of the State and the revenue of the country would be increased from ten to twelve millions of dollars a year, according to the length of the rainy season; and

Whereas, It is shown by competent Government engineers, after a thorough investigation of the mining situation, that it is practicable to construct such restraining dams in the mountain canyons as would hold back the debris from all the available mining ground in the State, and at a cost trifling in amount compared to the gold contained in such mining ground, and that by the construction of such dams mining of all kinds could be continued without injury to any other industry; and

Whereas, The decision of the Supreme Court of the United States and the rulings of the Department of the Interior have been adverse to the mining industry, the rule of the Court being calculated to turn over much valuable mining ground to the corporations when it decides that "the exception of mineral lands from grants by acts of Congress shall be considered to apply only to such lands as were at the time of the grant known to be valuable for their minerals," and the decisions of the Department being calculated to defeat the miner from procuring patent to his claim, wherein it rules that "the miner must show that the lands he is claiming possess a known, present, actual value for mining purposes;" and

Whereas, In the face of these facts the miners have remained inactive, believing in the justice of their cause and trusting that the Government would see their wrongs and redress them; and

Whereas, Instead of remedial measures being proposed they seem to feel the hands tightening around them; and

Whereas, They are convinced that further indifference to these growing evils, means the complete ruin of the miners' property and death to the mining industry; therefore be it

Resolved, That further indifference is dangerous—that the time has come for action—and to the end that the truth may be known and justice done, and that the mining industry, so essential to our State's prosperity, may be fully revived on a basis that will result in benefit to all and harm to none, we call upon every citizen of California to join in the agitation of such measures as will restore our rights and open the way for us to extract from Nature's storehouse the buried treasure that will enrich us, give employment to thousands of our fellow-men, and infuse new life into every industry in California.

Resolved, That a State Miners' Convention be called to meet in San Francisco, at some date in the near future, and we recommend that this Convention, now assembled, issue the call for said State Convention, appoint the delegates thereto, and instruct as to how they shall be elected.

Resolved, That said State Convention be requested to memorialize our Senators and Representatives in Congress to make sufficient appropriations for the construction of restraining dams for the impounding of mining debris, as recommended by the Board of Government Engineers.

Resolved, That said State Convention be also requested to memorialize our Senators and Representatives in Congress to secure such modification of the mining laws as will prevent the Interior Department from practically nullifying the intent of Congress in enacting them.

Resolved, By the miners of Placer county in convention assembled, that said State Convention be also requested to urge our Senators and Representatives in Congress to use every honorable means in their power as such Senators and Representatives, to secure a sufficient appropriation from the General Government to thoroughly dredge and otherwise improve the Sacramento, San Joaquin and Feather rivers, and to maintain the same in such improved condition.

Resolved, That coupled with the clause of the River and Harbor bill containing such proposed appropriation, we demand the insertion of a provision declaring that in consideration of such appropriation, and liberal appropriation on the part of the General Government for the improvement of such streams, and for the maintenance of work thereon, the right to conduct any or all classes of mining upon the tributaries thereof, shall thereafter be deemed lawful and shall not be subject to legal dispute.

Resolved, That it is the sense of the Miners' Convention that no general public property is a speedy and amicable settlement of this question, a settlement whereby the rights and interests of the miner and the farmer shall each be protected, and whereby millions of new money may be annually thrown into circulation among the people.

J. A. FISCHER,
 W. B. THORPE,
 ALLEN TOWLE,
 G. H. COLBY,
 FRANK SANDERS,
 Committee.

The reading of the above resolutions was frequently interrupted by applause, and at the

conclusion of the reading a motion to adopt the report as read was carried enthusiastically.

This completing the order of business as laid down, it was suggested that the convention proceed to issue a call for a State Miners' Convention. Acting on this suggestion, W. B. Thorpe moved that the chair appoint a committee of five to prepare and present for consideration a call for the State Convention. The motion was carried, and the chair appointed W. B. Thorpe, Allen Towle, Wm. Grinnell, W. D. Perkins and J. A. Filcher.

On the suggestion of Mr. Kennedy of Lincoln, the names of C. G. Yale (of the MINING AND SCIENTIFIC PRESS) of San Francisco, T. C. Hooking of Grass Valley, O. L. Cain of Placerville and H. A. McCrany of Lakeport were added to the committee.

Pending the report of the Committee, a motion was made by Hon. J. B. Patterson and carried, that the Convention resolve itself into "The Placer County Miners' Association," and that the officers of the Convention be the officers of the association for the first year, and that the members of the Convention be members of the association, and that all other miners of the county be requested to join the association at once by sending in their names and the initiation fee of \$1 to the Secretary.

On motion of R. L. Dunn, the chair was requested to appoint a committee of five from the Convention, and two at large, to draft an address to the people of the State for the purpose of more particularly attracting attention to the mining situation and stimulating interest in the same. The chair appointed as such committee R. L. Dunn, Dr. M. Schnabel, John M. Fullweiler, Hon. G. H. Colby and J. B. Hobson. At large, C. G. Yale of San Francisco, and Hon. J. A. Filcher of Auburn. On motion, the Chairman of the Convention, Hon. J. H. Neff, was added to said committee. Subsequently, on motion, the names of Hon. N. Martin of Dutch Flat, Judge D. W. Spear of Auburn, and Judge Amos Stevens of Colfax, were also added to said committee.

A permanent Finance Committee of the Association were appointed as follows: J. B. Hobson, Dr. M. Schnabel and J. C. Boggs.

D. W. Lubeck was appointed Treasurer of the association.

On motion, the following were named as a standing Executive Committee, with full power to promulgate the call and make all necessary arrangements for the Miners' State Convention, viz.: Hon. J. H. Neff, O. G. Yale, J. B. Hobson, B. F. Hartley and John Spaulding.

Subsequently T. B. Everett was elected Secretary of the Executive Committee.

We are unable, from lack of space, to give the names of all the delegates to the County Convention, or those appointed to the State Convention, but will do so next week. The call for the State Convention will be found elsewhere in this issue of the PRESS.

FEATHER RIVER GOLD.—General Secretary Edward Hauey and Managing Director J. S. G. Kirkpatrick of the Gold & Feather Channel Mining Company and the Golden Gate Alluvium syndicate (of which Frank McLaughlin of Oroville is general manager) have recently come from London, and have been making an inspection of the mine. About 145 men are at work at the mines, but thus far little gold has been procured.

THE JANIN PROCESS.—A dispatch from the Comstock, dated Dec. 2, says: The Janin brothers, who came here to try a process of reducing Comstock ore, which, it was claimed, would save a much larger percentage of the assay value than the process now in operation in Carson river mills, have returned to San Francisco and report that the test was a failure.

WORLD'S FAIR.—The California State Commissioners have passed resolutions as follows: That the commission out of the fund appropriated by the State (1) erect a State building and collect a State exhibit to be contained therein; (2) aid meritorious exhibits in the discretion of the commission to enter into competition in the different departments.

CALIFORNIA TIN.—Press dispatches state that the Temescal tin mines are now turning out three to four tons of pig tin per day. The new concentrators and ore-breakers that have been brought from England, at an expense of \$67,000, are in full working order, and the force of miners and laborers has been increased by 30 men.

THE LAST OF THE FRENCH COPPER SYNDICATE.—The factories, plant and good-will of the Societe des Metaux were sold at auction at Paris this week for \$3,600,010. This finishes up the famous French copper syndicate, which made a failure of cornering the copper product of the world.

The San Francisco Gaslight Co. is about to erect, at its works at North Beach, the largest gas-holder in America.

Comstock Milling Methods.

The suit of M. W. Fox against the directors of the Hale & Norcross Mining Co., which was continued over by Judge Hebbard from November 25th to the 30th, came up on Monday. The increased attendance of both miners and attorneys shows that interest increases in the suit, owing to the startling developments made as to the peculiar methods in vogue in the milling of Comstock ore.

The greater part of Monday morning was consumed in a legal fight over the admission of the books and records of the mine in evidence, owing to the strenuous objection of the defense; but the court admitting them, the examination of Clayton Belknap, secretary at Virginia City of the Hale & Norcross, was the first thing in order. By Mr. Belknap it was shown through the books that an aggregate of 88,887 tons of ore sent from the Hale & Norcross to the Nevada and Mexicon mills from December, 1887, to June, 1890, inclusive, of which about 75 per cent was sent to the Nevada mill, in which W. S. Hohart and Alvinze Hayward testified they owned each a two-fifths interest, and one-eighth of the remaining one-fifth is owned by Evan Williams, the superintendent. According to the record, the 88,887 tons of ore assayed from \$25.15 up to \$72.12 per ton, giving a total assay value of \$3,505,361.37, of which the mills only returned \$1,826,873.80. Attorney Baggett introduced 58 exhibits of car-sample assays taken at the mine during the months of December, 1888 and 1889, by which it appeared, particularly for December, 1889, that large quantities of low-grade ore were sent to the mill, which, the plaintiff claims, was for the purpose of bringing down a high average and enabling the mill company to mill ore at \$7 per ton. For instance, it is charged that in a great number of cases, cars assaying as low as \$8.50 per ton were sent to the mills which "pulped" about 60 per cent of the car samples and from which about 70 per cent of the battery sample was obtained. In other words, \$3.50 rock pulped about \$5, and there was obtained from this pulp 70 per cent, or about \$3.50, which cost \$7 to mill.

In the cross-examination of Mr. Belknap, he stated that the way he ascertained whether the mill was returning the proper amount of bullion was by comparing the amount of bullion which the mill notified him they were about to ship, with the pulp assay, and if the amount of bullion was equal to 70 per cent of the pulp assay, he thought everything was all right. When Attorney Baggett quoted from the report for March, 1890, when the mill assay was \$31.01 and the mill assay \$19.10, and the mill returned 35 per cent of the mill assay, and then asked, "Were you satisfied with 70 per cent of the battery assay of 35 per cent?" the witness hesitated in his answer, but finally said that the mill was interrupted and the flume broken, which brought out the following question, "Was the bullion carried off on the broken flume?" but to which the witness did not respond.

On Tuesday morning, Alonzo C. Hamilton, superintendent of seven Comstock mines, was placed on the witness-stand and testified that he was a director of the Hale & Norcross mine from March, 1887, until a year later. He had received notice from San Francisco that he was elected a director, but never attended any meeting or paid any special attention to Hale & Norcross affairs. He saw Chollar and Hale & Norcross assays made, both car-sample and pulp assays. He had noticed a great difference between the car-sample and pulp assays, but did not say anything about it. He owned an eighth interest in the Nevada mill, but which did not cost him anything. He stated that he had not received any dividends from his interest in the Nevada mill, and also said that the mill had bought stock for him, but how much he was unable to say. This stock he did not pay for, but supposed Mr. Hayward did. The stock, he thought, Mr. Hayward either has or it is in some broker's hand.

The afternoon was taken up with the examination of Evan Williams. He was questioned with reference to an unstamped bar of bullion, weighing 218 ounces, of which, it appeared, the books made no mention. He said he knew nothing about the bar, and could not say whether or not it had ever been deposited in the bank. Mr. Williams stated that he might have deposited bullion in the Mint at Carson in the night time, but he did not know any of the Mint watchmen. He testified that he had paid several thousand dollars to H. M. Levy, president of the Hale & Norcross Mining Company, and that he received the money from W. S. Hohart. He did not know why the money was paid to Levy. "You will not admit," asked

Mr. Baggett, "that the money was paid to Mr. Levy to keep him from complaining of you in reference to the manner in which you milled the Hale & Norcross ore?" The witness answered that he knew nothing about the matter. For the year 1890, down to July 9th, beyond which the inquiry could not extend, five checks were drawn, aggregating \$7821.60, payment on which, it is claimed, was made to Levy as his share for assistance in the manipulation of Hale & Norcross millions. Mr. Williams' examination for the day ended with an explanation in detail of the manner in which ore was milled at the Nevada mill while he was superintendent there.

The examination of Mr. Williams was resumed on Wednesday. According to the *Chronicle's* published proceedings of the case, the morning session of court was technical and therefore dry. Mr. Williams gave considerable technical testimony relative to the milling of ores at the Nevada and Mexican mills, of which he was superintendent. The interesting fact was developed that the Mexican had a little annex of its own, but it has only two pans grinding out sulphurets and concentrates. The manner of taking pulp assays by tank shovel-

The Stahl-Rew Amalgamator.

From the report of the Secretary of Mines for Victoria (Australia) we reproduce parts of the Stahl-Rew amalgamating pan. The patent includes both center and outside feed, to be used as an alternate method of feed and discharge, as may be preferred. If the outside feed is used, the inner circle of sheet iron is taken out, the allmes, tallugs, etc., fed in at the top, between the outer casing of sheet iron or cast iron and the inner casing of the same class of iron, the rubber and iron ring on the miller making a perfectly water-tight joint, compelling the slimes to be drawn under the grinding surfaces, and by the centrifugal motion, brought in direct contact and swirled about in the mercury well under the false bottoms, thereby insuring perfect amalgamation. After grinding and amalgamation, the debris passes up through the central hole of shoes and miller into the body of the pan and brought in

side feed. The central feed renders the rubber joint unnecessary. With the save-all and shower-box, it is of no consequence if the mercury should flow as in other pans. It will be collected by being sprayed down on the floating plate, the residue collected in the basin by being continually rolled over and over by the copper-lined bracketed muller.

In the inventors' experiments, they have found that all the fine flour gold is lost through its extreme fineness and the want of suitable appliances to insure amalgamation. Assays made by Mr. Rew for a number of years showed that gold is lost in dirty water at the rate of 1 grain for each 300 gallons of water used in treating ores, and in many instances from 1 to 8 dwts. per ton of ore.

By reference to the cuts, the construction of the plan will be readily understood: A, inside of pan, to contain slimes after being ground and amalgamated, passing away by the overflow shoot at A1; a, inner circle of sheet

I, vessel for generating hydrogen gas from muriatic acid, zinc and ammoniac chloride, for keeping mercury bright, giving it the power to disperse the air film surrounding particles of gold, thereby insuring perfect amalgamation; i, pipe for conveying hydrogen gas to mercury; ii, regulating tap.

J, valve to allow of alternate feed, center or outside; J1, perforated shower-plate, drop 14 inches.

K1, save-all complete, intended to revolve slowly over a bed of mercury, whereby all floored mercury or fine amalgam may be collected if any escape the floating plate, and collect any mercury that by accident or otherwise may pass through other receptacles; K, revolving disc or muller, carrying on the underside 24 amalgamated copper-lined pine battens, with spaces of three quarters inch in between each batten. This disc is for rubbing the tail waste into the mercury below. A corrugated copper disc can be used if preferred; k, bed of mercury; k1, head of driver and central feed hopper, the feed falling from shoot on to perforated iron plate, for equal distribution on to mercury.

L, collecting tub for cleaning up and collecting mercury and amalgam; l, discharge pipes from various mercury wells to central cleaning-up tub.

A Miners' State Convention.

About all the prominent industries of the State have permanent organizations except that of mining. Representatives of these industries meet and discuss their needs, and some attention is paid them. The miners, however, have not heretofore banded together for mutual support and defense. Had they done so before, the industry in this State would have been in better condition than it is to-day. There are many things unknown to the general public, which tend to depress our mining industry. Gradually the area open to the prospector is being narrowed by unjust, if not illegal, practices. The rulings of the Departments are such as to nullify the Acts of Congress and practically change the laws. It is almost impossible to obtain patent to mineral land. Other classes of claimants are favored as against the miners. The hydraulic mining question requires unbiased examination and judgment in order that injustice shall not be done.

These and other things need to be discussed. The miners are the men who originally settled this State, but of late they have been ignored and these miners injured by misrepresentation and neglect. The time has come for them to speak. They will therefore organize and bring themselves and their grievances to the attention of the people of this State, and Congress. Placer county has been the first to move and her citizens now call upon miners in other counties to assist in rehabilitating the gold and silver mining industry of California.

At the Placer County Miners Convention last week, a committee was appointed to prepare a call to the miners of California, and this has been issued. It is as follows:

The miners of Placer county, in convention assembled, hereby issue a call for a Miners' State Convention, to meet in San Francisco on Wednesday, the 20th day of January, 1892, at 2 o'clock P. M.

The apportionment of delegates to said Miners' State Convention shall be thirty (30) from each county in California, except San Francisco, which shall be entitled to sixty (60) delegates.

Said delegates shall be elected by a convention of miners and mining sympathizers, called to meet in each county on or before the first day of January, 1892, for that purpose. Any three or more miners may issue the call for said County Convention.

If, however, in any county in the State, the miners fail to meet and elect delegates, as herein provided, on or before the 1st day of January, 1892, then the Supervisors may, and they are hereby requested to appoint the delegates which their respective counties are entitled to in said State Convention; provided, that no man who is unfriendly to the mining interests shall be eligible to a seat in said convention, and where the Supervisors may appoint such delegates, they are requested to discriminate in favor of mining men.

COAL RECEIPTS.—For the month of November, 1891 546 tons of coal came to this port. Of this, Puget Sound sent 31,294 tons, Oregon 2570, and the balance was foreign; 42,119 tons came from British Columbia. Thus far this year we have received 1,427,789 tons of coal, of which Puget Sound sent 374,722 tons.

STAHL-REW PATENT GRINDING AND AMALGAMATING PAN FOR SAVING FINE GOLD AND MERCURY.

ers was identical at both mills. The samples were taken by the foreman under the general direction of the witness to take correct samples. He described the Archimedeal screw which raised the material from the agitator on to the coarse blankets, through which, with the use of water, it settled into the tanks and was carried back to the sand floor and goes into the amalgamating pans.

At the close of the morning session, Mr. Williams was served with a summons making him a party defendant in the suit as the representative of the Nevada M. and M. Co., of which Mr. Williams, A. Hayward and W. S. Hohart are the principals.

In the afternoon Attorney Baggett interrogated the witness at length on redirect examination with a view of showing that in the milling of the Hale and Norcross ore at the Nevada mill it was possible to produce millions without any record of it being kept. The witness was in general charge of the mill, but much was entrusted to the watchmen, foremen and clerks in the mill. The witness lived at Empire, about 10 miles from the Nevada mill, and he usually visited the mill two or three times a week. Referring to the value of tallings from the Hale and Norcross ore, worked at the Nevada mill, the witness said the total value was \$14,800. When asked how he had secured those figures, as he had previously stated that there was no record of the value of tallings, he replied that he obtained the figures from the milling company, and presumed they were correct. The remainder of the testimony was unimportant.

contact with amalgamated or electro-silvered copper plates, thence to the discharge, over an electro-silvered plate; from this plate into a perforated plate, with holes one-sixteenth of an inch diameter, and showered down by a fall of 11 inches on to a slip of amalgamated copper plate floating on a bed of mercury, the debris passing from this into the center of a slowly revolving bracketed muller, with the under side of brackets lined with amalgamated copper revolving in a basin three-fourths inch deep, containing a bed of mercury from one-fourth to one-half inch deep. The mercury in this basin and under the floating plate of shower box is kept in good working order by hydrogen gas generated by scrap zinc, muriatic acid and chloride of ammonia, and injected into the mercury from the generator, through flexible tubes. By this means floored mercury is recovered.

When the central feed is used, all that is required is to put on the inner circle, marked No. 3, take out the rubber joint and the top malleable iron ring of muller, turn the feed into the central space, the debris passing down under the shoe and between the false bottoms, ground, amalgamated and discharged at the periphery into the body of the pan, and undergoing the same process as described for the out-

iron; a1, outer circle, of either cast or sheet iron, of pan. The space of four inches between the two circles of iron marked a2 is used for introducing the feed direct under the muller shoes and mercury-well; A2, distributing-box, five feet long; A3, pine mercury-well, with pine check-board.

B, outer feed shoot; B1, inner feed shoot.

C, main cast-iron bottom, in four segments; c, false bottoms (12 pieces).

D, muller; d, rubber, three-fourths inch square; d1, iron liner, three inches deep by three-eighths inch thick; on the face of this liner, the rubber presses to make water-tight joint, thereby insuring the feed passing under and between the grinding surface, passing into body of pan through the center hole.

E, three-inch vertical driving shaft; e, driving or muller arm; e1, head of driver.

F, sleeve or column, containing brasses at top for vertical shaft; f, counter-sunk bolts by which center column of sleeve is bolted down to main bottom.

G, amalgamated copper or electro-silvered copper-plated wings; g, angle-iron ribs for fastening wings to.

H, amalgamated copper plate, floating on bed of mercury, to receive shower of tail waste of pan; h, mercury; h1, mercury-well.

NEW AND VALUABLE BOOKS

—FOR—

METAL WORKERS.

LANGBEIN.—A Complete Treatise on the Electro-Deposition of Metals. Comprising Electro-Plating and Galvanoplastic Operations, the Deposition of Metals by the Contact and Immer-into Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Descriptions of the Electric Elements, Dynamo-Electric Machines, Thermopiles, and of the Materials and Processes used in every Department of the Art. Translated from the German of Dr. George Langbein, with additions by William T. Brannet, editor of the "Techno-Chemical Receipt Book." Illustrated by 125 engravings. In one volume, 8vo, 404 pages. Price, \$4.00.

BLINN.—A Practical Workshop Companion for Tin, Sheet-Iron and Copper-Plate Workers. Containing rules for describing various kinds of Patterns used by Tin, Sheet-Iron and Copper-Plate Workers. Practical Geometry; Mensuration of Surfaces and Solids; Tables of the Weights and Strengths of Metals and other Materials; Tables of Areas and Circumferences of Circles; Composition of Metallic Alloys and Solders, with numerous valuable Receipts and Manipulations for every-day use in the workshop. By Leroy J. Blinn. A new, revised, and enlarged edition, printed from new type, and containing a vast amount of valuable matter in all the Metals and Alloys, not to be found in any other book in the English language. Price, \$2.50.

BRANNET.—The Metal Worker's Handy Book of Receipts and Processes—Being a Collection of Chemical Formulas and Practical Manipulations for the Working of all the Metals and Alloys, including the Decoration and Beautifying of articles manufactured therefrom, as well as their preservation. Edited from various sources by William T. Brannet, editor of "The Techno-Chemical Receipt Book." Illustrated by 65 engravings. Over 500 pages, 12mo, cloth, gilt, elegantly printed, containing a vast amount of valuable matter in all the Metals and Alloys, not to be found in any other book in the English language. Price, \$3.50.

BRANNET.—The Metallic Alloys. A Practical Guide for the Manufacture of all kinds of Alloys, Amalgams, and Solders used by Metal Workers, together with their Chemical and Physical Properties, and their application in the Arts and Industries; with an Appendix on the Coloring of Alloys. Translated and edited, chiefly from the German of A. Krupp and Andreas Wildberger, with extensive additions, by William T. Brannet, one of the editors of "The Techno-Chemical Receipt Book," etc. Illustrated by 16 engravings. 12mo, 428 pages. Price, \$3.00.

A NEW BOOK ON ASSAYING.

THE BEST IN THE ENGLISH LANGUAGE.
IT LEADS ALL OTHERS!

RECENTLY PUBLISHED.

THE ASSAYER'S MANUAL.

An Abridged Treatise on the Doctrines Examination of Ores, and Furnaces and other Artificial Products. By BRUNO KIRK, Professor in the Royal School of Mines, Member of the Royal Technical Commission for the Industries, and of the Imperial Patent Office, Berlin. Translated from the German by WILLIAM T. BRANNET, Editor of "The Techno-Chemical Receipt Book," etc. Second American Edition. Edited with extensive additions by F. LYNNWOOD GARRISON, Member of the Am. Institute of Mining Engineers, Iron and Steel Institute, Verein Deutscher Eisenhüttenleute, etc. Illustrated by 87 Engravings. Three hundred and fifty-four pages, 8vo, cloth, price \$3.00. By mail, free of postage, to any address in the world.

Abstract of Contents: GENERAL DIVISION.—I, Mechanical Manipulations; II, Chemical Operations; III, Assay Furnaces; IV, Assay Vessels; V, Balances and Weights; VI, Tools and Implements; VII, Assay Reagents. SPECIAL DIVISION.—I, Lead; II, Copper; III, Silver; IV, Gold; V, Platinum; VI, Nickel; VII, Cobalt; VIII, Zinc; IX, Cadmium; X, Tin; XI, Bismuth; XII, Mercury; XIII, Antimony; XIV, Arsenic; XV, Uranium; XVI, Vanadium; XVII, Chromium; XVIII, Manganese; XIX, Sulphur; XX, Fuel; Appendix; Index.

A circular of 8 pages, quarto, giving the full Table of Contents of this important Book, as well as a new List of Leading Books on Metal-Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, etc., sent free to any one in any part of the world who will apply.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Dec. 3, 1891.

As usual, the last month of the year witnesses a dull market in all branches of trade. Rains are wanted in all parts of the State for both mining and agricultural purposes. With heavy rainfalls in the valleys and deep deposits of snow on the mountain ranges, a prosperous season in 1892 is assured. Among iron-workers, an undue degree of activity for the time of year is reported. Many firms are taking advantage of present low prices ruling for raw materials, by buying and storing for future use. The local money market continues easy, and no friction is now looked for, even during the time when the usual demands are made in this month on call borrowers.

Eastern advances are confirmatory that all kinds of business will enter 1892 in a more prosperous condition than ever before known, which condition will hold the greater part of, if not throughout the year. Mr. Depew outlined it when he said, at the Chamber of Commerce banquet at New York: "There is to be a famine of cars, a famine of locomotives, a famine of the methods by which this enormous product which the fields of the country have produced may be conveyed to the sea, and so go abroad where it is needed." These conditions, he said, are going to make railroads more than usually prosperous in their net earnings; are going to lead to the construction of new lines of railway; are going to make a demand for iron, coal and coke. Making due allowance for flowers of rhetoric, the prophecy, there is reason to believe, will be literally verified. The gross amount of railroad earnings for September shows a gain of \$4,500,000 as compared with the same month last year, and the net increase was 10.32 per cent.

QUICKSILVER—Receipts the past week aggregate 560 flasks. The combination bought the past week the largest producing mine in Napa county. The market is steady at pool quotations.

MEXICAN DOLLARS—The market is slow at around 74½ cts.

SILVER—The market hangs around at prices current the preceding week. The Mint is in the market for its December quota, 4,500,000 ounces, but the buying has not made any perceptible effect on the market. The shutting down of the mines in the Candelaria district, Nevada, is offset through increased milling by the Tascara mines. Some action is expected to be taken at an early day by Congress looking to passing a free coinage bill.

LIME—Receipts the past week aggregate 7076 bbls., of which 2000 bbls. came from Oregon. The market is unchanged.

BORAX—Receipts aggregate 444 cts. The market is steady at combination quotations.

ANTIMONY—The market is quiet but firm.

LEAD—Last week 3000 pigs were shipped by water to New York. The market is barely steady. The East reports small supplies and smelters indifferent sellers. Buyers only take as required to meet their most urgent requirements.

TIN—The market is heavy and dull. Eastern advances report that several heavy blocks have changed hands, but still the market hung heavy. London advances, are more favorable to tin holders, yet if tin-plate makers curtail their output, the consumption will fall off.

IRON—The market is steady and firm. English advances report stronger views for shipment, due largely to higher freight rates. Eastern mail advances report a soft market, with concessions offered to buyers for delivery in the forepart of 1892.

COPPER—The market is hard to report satisfactory. Iron Age says of the New York market: On the part of the representatives of the leading producers, a certain degree of indifference is assumed and the principal consumers, it would appear, are equally as indifferent. Digging below the surface, however, some evidence of the disposition to get together at about 10 cents for deliveries running through the first quarter of next year is discovered, and the indications are that a liberal-sized deal will be effected at that price. For casting brands the nominal price is 10½ cts., but both the demand and the supply available for early delivery are so slight that other than purely "nominal" prices cannot be arrived at. In some instances, Arizona ingot has been delivered on contracts for ordinary casting stock, owing to inability to secure the latter, and it is not likely that the cheaper article will be more plentiful for some little time to come.

COAL—Imports the past week aggregate as follows: Seattle, 2660 tons; Newcastle, N. S. W., 4037; Carmelo Bay, 200; Departure Bay, 5337; Cardiff, 6037; Swansea, 3207; Liverpool, 146; Nainaimo, 2000; total, 23,981 tons. For spot and near-by cargoes the market is heavy, but for shipment or just shipped there is a strong tone. The declining freight market with us causes higher outward freights to us. The consumption with us continues free.

Eastern Metal Markets.

By Telegraph.

New York, December 2.—The following are the closing prices the past week:

	Silver	Copper	Lead	Tin
Thursday	43 9-16	94 1/2	11 10	4 30
Friday	43 9-16	94 1/2	11 10	4 30
Saturday	43 9-16	94 1/2	11 10	4 30
Monday	43 9-16	94 1/2	11 10	4 30
Tuesday	43 9-16	94 1/2	11 10	4 30
Wednesday	43 9-16	94 1/2	11 10	4 30

Copper shows more activity at lower prices. Lead is barely steady. Tin continues to shade. Borax is steady, as is quicksilver.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. ELM STREET, DALLAS, TEXAS. Branch Houses.

DIAMOND ROCK DRILLS.

For prospecting Mineral Veins and Deposits, Boring Vertically, Horizontally, or at any angle to any desired
depth, taking out a Cylindrical Section or Core the entire distance, showing exact character, and giving a perfect
section of the strata penetrated. Also for Boring Artesian Wells perfectly straight, round and true.

Machines for Channeling, Gadding and other kinds of Quarry Work, Shaft Sinking, Tunneling, Mining,
Railroad and all classes of rock-boring. Manufactured by

THE AMERICAN DIAMOND ROCK BORING CO.,

15 CORTLANDT STREET, NEW YORK.

P. O. Box 1442.

Send for Catalogues and Price List.

ESTABLISHED 1866.

Pacific Chemical Works.

HENRY G. HANKS,
Practical and Industrial Chemist, Assayer
and Geologist.

718 MONTGOMERY ST., - SAN FRANCISCO.

Will report on the condition and value of any mining property on
the Pacific Coast. Rare Chemicals made to order. Instructions given in
Assaying and Practical Chemistry

Malthine Mfg Co.

FACTORY:

Cor. Jefferson & First Sts., Oakland, Cal.

MANUFACTURERS OF

**ACID, ALKALINE AND WATER-PROOF
PAINTS,**

Superior to anything of the kind in the market for

IRON, WOOD AND TIN.

Unequaled for Submerged Timbers. Red and Brown
Paints for Roofs, Warehouses, Stables, Fences,
Etc., mixed Ready for Use. Also,
Sheathing Paper, Portland Cal.
Horn's Mastic Roofing,
the Best in the
Market
for

RANCH AND CITY.

AND UNEQUALED FOR

**Teredo-Proof Pile
Covering.**

This Company also Manufactures a Malthine
Compound for

**RENDERING BOOTS AND SHOES
WATERPROOF.**

The same is a superior article for Preserving Harness
rendering it Impervious to Moisture and
keeping it always pliable and soft.

Send for Samples and Prices. Salesroom,

310 CALIFORNIA ST., S. F., Cal

CLAYTON
IMPROVED
MINING PUMPS
ROCK DRILLS
AIR COMPRESSORS
For CATALOGUES, ESTIMATES, ETC., ADDRESS,
Clayton Air Compressor Works
OF BROOKLYN, N. Y.
43 DEY ST., NEW YORK.

FRANCIS SMITH & CO.,
Manufacturers of
**Sheet Iron and Steel
PIPE!**
ALL SIZES.

130 Beale Street, San Francisco, Cal.

Iron cut, punched and formed, for making pipe or
ground. All kinds of Tools supplied for making Pipe.
Estimates given. Are prepared for coating all sizes of
Pipe with a composition of Coal Tar and Asphaltum.

NEW YORK BELTING & PACKING CO. Limited.

JOHN H. CHEEVER, J. D. CHEEVER, F. CAZENOVE JONES, Managers. 15 Park Row, New York.
WM. T. BAIRD, Secretary. OLDEST and LARGEST Manufacturers in the United States of

Vulcanized Rubber Fabrics
For Mechanical Purposes.
Extra Rubber Belting and Hose
For Mining Purposes.
SOLID VULCANITE EMERY WHEELS
Pacific Coast Agents, **ARNETT & RIVERS,**
17 & 19 MAIN STREET, SAN FRANCISCO, CAL.

IMPROVED FORM OF HYDRAULIC GIANTS.

THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC
GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style.
The latter, however, we furnish when requested. Prices, discounts and Catalogues of our specialties of Hydraulic
Mining Machinery sent upon application.

JOSHUA HENDY MACHINE WORKS. 39 to 51 Fremont St., San Francisco.

A. J. VAN DRAKE,
Machinist and Mechanical
Engineer,
203 Fremont St., San Francisco.
SPUR AND BEVEL GEARS CUT TO ORDER.
Patent Models
And Experimental Machinery of All Kinds.
Shafting, Pulleys and Boxes.
Engines and Boilers.
DRAWINGS, PLANS and SPECIFICATIONS made for
new machinery.
Jobbing of every description promptly attended to.
FINE WORKMANSHIP GUARANTEED.

**KEYSTONE
BOILER WORKS**

HAMILTON & LEACH,
Main and Folsom Sts.,
SAN FRANCISCO, - CALIFORNIA.

ALEX. HEINS

(Successor to Heins & William),

Manufacturer of Leather and Fulled Rawhide

BELTING,
ROPE, LACE AND PUMP LEATHER,
ETC., ETC.

134 MAIN ST., SAN FRANCISCO, CAL.

WINANS' ANTI-INCORUSTATION POWDER

For Preventing and Removing the Formation of Scale in STEAM BOILERS.
Approved by The Union Iron Works, The Riedon Iron Works, The Pacific Iron Works,
the Cable Railways, many Steam Vessels and by a large number of Important Fac-
tories, Foundries, Etc. BEWARE OF IMITATIONS now offered!

AGENT FOR —
Peerless Platen and Valve Rod Packing, Peerless Rainbow Sheet
Packing, Gonid's Combination Rod Packing, Manhattan
Rod Packing, Magnolia Anti-Friction Metal
Pulver Lubricating Compound.

All guaranteed to be of Superior Quality and Greatest Economy. Send for Circular to
J. O. WINANS,
220 FREMONT STREET, SAN FRANCISCO, CAL.

**MINES BOUGHT AND SOLD
IN THE PACIFIC NORTHWEST.**
Address **CHARLES F. BLACKBURN & CO.**
Seattle, Washington.

GOOD NEWS FOR THE BLIND.
DR. L. A. GRANGE
TREATS SUCCESSFULLY ALL DISEASES OF THE
Eye without operation. Residence and Office, 1432
Geary St., corner Laguna, San Francisco.

THE RUSSELL PROCESS.

For information concerning this process for the re-
duction of Ores containing precious metals, and terms
of license, apply to

THE RUSSELL PROCESS CO.,
Park City, Utah.

**DEWEY & CO., PATENT AGENTS, 220
Market St., San Francisco. Elevator, 12 Front St.**

SHEET IRON AND STEEL PIPE

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.
— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES,

For Water Supply, Mining, Irrigating Purposes, Stock
Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed
Charcoal Iron of great tensile strength.
The weight or thickness of metal used, is graded according to service
required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe
in a bath containing a special mixture of ASPHALTUM, BITCH and
PETROLEUM, at a Temperature of 300° Fahrenheit. It thus
receives a thorough coating, both inside and outside, rendering it impervious
to the alkalies of the earth, rust, etc., and is practically indestructible.

CORRUGATED IRON,

Black, Painted and Galvanized, for Roof and Sides of

HAY BARN, DRY HOUSES, STABLES ETC.

W. W. MONTAGUE & CO.
SAN FRANCISCO—SAN JOSE—LOS ANGELES.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have
our new Concentrating Belt manufactured in
San Francisco; we can therefore fill all orders
on short notice. The length and width of these
belts are the same as is used on the Frue
or Triumph Concentrating Machines, but can be made of any
length or width desired. The advantages of these belts
over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute
angle inclining toward the center, and therefore readily
conform to the change of direction while passing over
the end rollers; thus the vexation and loss caused by the
frequent breaking of the flanges of the old style belt is
practically done away with. Again, our belts, at intervals
of two to four feet, have a very slight rifled surface for the
space of three inches, which tends to equalize the pulp
on the belt, and prevents it from banking on the sides and
forming channels through the center. These slight rifles
also save very fine sulphurets and the quicksilver that
would otherwise escape with the tailings from a belt,
the surface of which is entirely smooth.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

RAND DRILL COMPANY,

ROCK DRILLING, AIR COMPRESSING,
MINING AND QUARRYING

MACHINERY,

23 PARK PLACE, NEW YORK,

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.

143 LIBERTY STREET, NEW YORK, U. S. A.

PELTON WATER MOTORS.

Varying from the fraction of 1 up to 40 and 50-horse power, unequalled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above.

THE GATES ORE AND ROCK BREAKER.

UNLIMITED IN CAPACITY. UNEQUALED IN EFFICIENCY, UPWARD OF 3,000 NOW IN USE. Will do more than twice the work of any other with the same cost in wear. Gives a fineness of product that increases the capacity of any mill from 25 to 40 per cent without any additional expense. THE BEST AND ONLY CRUSHER ADAPTED TO MACADAM ROAD WORK. Send for Circular.

It having come to the notice of the undersigned that their patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted. (Signed) THE PELTON WATER WHEEL CO.

FRUE ORE CONCENTRATOR

OVER 8000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and demonstrated that they are a success.

The above figures of the number of machines that have been sold tell the tale of their popularity, and show that they have gained a reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circular testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880

September 18, 1883; July 24, 1888;

and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

Price of Improved Belt Frue Vanner, \$825, f. o. b.

A New Coal Undercutting Machine.

The undercutting of coal by machinery is an important problem for the mining fraternity. The undercut may be made by hand, but this method not only adds largely to the expense of mining coal, but also makes a large quantity of fine coal or slack, which is comparatively a waste product, except in certain cases. A successful machine not only cheapens production, but also increases output and insures the mining company, in a large measure, from delays and shut-downs. There are several types of machines on the market and in actual operation, but the one herewith illustrated works in an entirely different line from other machines.

The New Arc machine consists of the following parts: A heavy iron base cast in one piece serves as a foundation for all the parts, carrying two pairs of axles one at right angles with the other. The gauge of one pair is fixed to suit the regular track gauge of the mine wherein the cutter is to work, and these axles carry small flanged wheels upon which the cutter is easily moved about the mine and in and out of the rooms. The second pair of axles carry small wheels for supporting the cutter when in actual operation and carrying it along the face of the wall being cut. They are not flanged, but are kept upon the track by two pairs of single and two pairs of double guides, as shown in the illustration. The support of the machine is easily changed from one pair of axles to the other by means of a cam worked by screws, the larger flanged wheels being raised out of the way when the cutter is in actual operation, as shown in the illustration.

The motive power is furnished by a 15-H. P. motor, which in the latest machine is somewhat changed from that shown, the motor being perfectly water-tight and thoroughly protected from all danger of mechanical injury. The armature shaft carries a bevelled pinion at each end. That nearest the commutator is made to engage by means of a controlling lever, either one of the two bevelled gears shown in the illustration, thereby giving the shaft on the

LARGE-SIZED TRIPLEX ELECTRIC PUMP.

THE NEW ARC COAL UNDERCUTTING MACHINE.

right a right-handed or left-handed rotation. By means of the chain of gears and an ingenious mechanical device, this shaft operates the feed chain at practically any desired speed. The feed chain is made fast to a post ahead of the machine, and in this way the cutter is drawn forward at a speed under control of the operator, and which can be varied with the hardness of the coal. The same gearing, by means of another controlling lever, is made to move the arm from position alongside the machine at the beginning of the cut to the position shown in the illustration, where it is held rigidly during the remainder of the cut. The second pinion on the armature shaft operates the endless chain, carrying the cutting knives about the arm. The controlling devices are such that the cutter may be held stationary while the knives are in operation, an important point in drilling through particularly hard formations. The length of the arm carrying the endless chain is made to suit the requirements of the mine in which it is to operate, the undercut usually being made of a depth equal to the thickness of the vein.

The length of the arm is adjustable within certain limits, in order to take up the stretching of the chain due to wear. The chain and knives are drop-forged and of a strength to withstand the hardest usage. The knives are easily detachable from the chain, so that a new set of sharp knives may be substituted for the old set in a very short time. The track along the face of the work consists simply of two rails with an iron cross tie, and may be laid and removed in a very short time and with a small amount of labor. By the use of this track and this type of machine, necessity for moving a heavy piece of apparatus by hand oftentimes in a very low room is avoided, a very important point, as any one who has had experience in these matters can testify. For its operation the cutter requires two men, one of whom is at the machine itself controlling the rheostat and operating devices, and the other keeps the track laid ahead and sets the posts for anchoring the feed-chain. All trouble with the slack clogging up the cut is removed, as the knives themselves bring nearly all the slack outside the cut, leaving a clean space.

The machine is thus seen to possess very important advantages in all kinds of working, and for large rooms or a logg wall system, these advantages become all the more prominent. It is operated on a 220-volt current, making it entirely harmless electrically. The New Arc is handled by the Thompson-Ven Depoele Electric Mining Co., 620 Atlantic avenue, Boston, to whom should be addressed inquiries regarding it.

The Gould Electric Pump.

On this page is given a photo-engraving of the largest-size Gould triplex electric pump, designed to produce a discharge of constant velocity. The original power generating the electricity may be placed a long distance from the pump itself, which is very often a great convenience. This large pump is adapted for many purposes, and may be placed in situations not suited to an ordinary steam pump.

A MEETING of miners has been called in Nevada county to appoint delegates to attend the State Mining Convention in San Francisco, January 20th.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

La Plata, Utah.

EDITORS PRESS:—Having seen nothing recently in the columns of the MINING AND SCIENTIFIC PRESS relative to the camp of La Plata, Utah, doubtless it would be well to send you the following items relative thereto.

This mining camp is situated in a high plateau, 22 miles northeasterly from Ogden, Utah, and the first locations were made in August of the present year. The ores are argentiferous galenas, along with a very fine class of carbonate ores.

About ten days after the first discovery of galena at that place, the writer, accompanied by three others, quietly stole away from Ogden to investigate the newly discovered bonanza. Believing that we were about to be blessed in being allowed to get in on the ground floor of a new camp, we stole silently and quietly away from Ogden at midnight. Taking up through Ogden canyon, we passed the primitive granite formation that forms the base rock of the great Wasatch range of Central Utah. Passing on up the canyon, where a roaring river shouts out the human voice, we beheld what is a fine lesson in nature for the geologist. Succeeding each other in a vertical position, stand a hundred mighty strata of lime, slate, sedimentary sandstone and quartzite, until the canyon is passed, and a low range of mountains is reached beyond Ogden valley.

This range of low mountains is made up entirely of slate, lime and quartzite, in which a very good class of galena ore has been found from time to time by the Mormon herders during the last 30 years, but up to the past summer, no attention of the outer world was given to the region.

It was after a hard ride that we halted beyond the head waters of the Middle Fork of Ogden river, and found the newly discovered prospects of silver-bearing lead ores.

At that time there were but three locations, namely, the Sundown, the La Plata and the Dead Rat. They were owned by stockmen, who, excited by the bright galena ore, imagined that they were the possessors of boundless wealth.

As the galena cropped in great masses from the surface, it was evident that an immense deposit of mineral would be taken from the district and in the Sundown mine we found lying up against the galena a stratum of very good cuprite copper ore running as high as 83 per cent in copper.

The formation we found to be entirely of dolomite lime flanked to the eastward by a quartzite formation, and in this formation of lime to the width of about three miles lead and copper ores abound running high in these metals, but very low in gold or silver.

The region is a high and beautiful plateau, well wooded and well watered, easy of access via the Middle Fork of Ogden river from Ogden; being thus near to railroads there is no doubt but that next summer will see a thrifty mining camp at La Plata. At present the chief mines there are the Red Jacket, the Sage Hen, La Plata, Sunrise, Sundown, Last Dollar, Last Lime, the Warleigh, Queen of the Hills and Moonlight in each of these there is a good showing of either carbonate or galena.

In the Red Jacket a clearing 70 feet long and eight feet wide has been made entirely in ore, which although an ore that is low in silver, yet, as it runs from 60 to 80 per cent in lead, it will like the others be truly a bonanza to its owners.

The country in which these mines exist is mineral bearing over a large extent. An area of 900 square miles lies open to the willing prospector, and at present about 300 souls dwell at La Plata.

The country is easy of access, wood and water are plentiful and the necessities of life are cheaply procured from ranchmen in the valleys below. From 31 assays taken of the ores of La Plata, we found lead to run to an average of 60 per cent and silver \$5.83 per ton. The cheapness with which ores of this class may now be worked in Utah and Colorado warrants us in believing that La Plata is destined to become one of the great lead-producing camps of the Pacific Coast.

DON MAGUIRE.

Ogden, Utah, Dec. 2, 1891.

Record Your Mining Work.

There is a law, passed by the last California Legislature, of especial interest to miners, but of which many miners, no doubt, are ignorant. It is entitled "An Act Entitled an Act Relating to the Working Rights of Way, Easements and Drainage of Mines in the State of California," and will be found on page 219 of the Statutes of 1891. The portion of especial interest reads as follows:

SECTION 1. Whenever any mine-owner, company or corporation shall have performed the labor and made the improvements required by law for the location and ownership of mining claims or lodes, such owner, company or corporation shall file or cause to be filed, within thirty days after the time limited for performing such labor or making such improvements, an affidavit with the County Recorder of Deeds of the county in which the mine or claim is situated, particularly describing the labor performed and improvements made, and the value thereof,

which affidavit shall be prima facie evidence of the facts therein stated. Upon the failure of any claimant or mine-owner to comply with the conditions of this Act in the performance of labor, or making of improvements upon any claim, mine or mining ground, the claim or mine upon which such failure occurred shall be opened to relocation in the same manner as if no location of the same had ever been made. But, if, previous to relocation, the original locators, their heirs, assigns or legal representatives, resume work upon such claim, and continue the same with reasonable diligence until the required amount of labor has been performed or improvements made, and the required statement of accounts and affidavits filed with the County Recorder, then the claim shall not be subject to relocation because of previous failure to file accounts.

The balance of the Act is mainly a repetition of the United States Statute which provides how the required work shall be done by the owners, and which explains the proceedings necessary to forfeit the interests of such owners as fail to perform their share of the work.

One of California's Miners.

There died at Wright's Sanitarium, near San Jacinto, San Diego county, Nov. 7th, Pharez Allen Clark, a gentleman whom many miners and others of Northern California will well remember. Born in Illinois in 1845, removed to Iowa, from whence in 1860, in company with his parents, they started westward across the plains by means of ox-team prairie schooners, landing in California in that year. He had a natural aptitude for mining and also became an expert assayer and metallurgist. The famous silver excitement in the Santa Rosa district of Alpine county was his first field of operations, where he was soon made Recorder of the mining district, as also being made a postmaster and holding various offices of trust in that county. Although a large man physically, six feet six inches tall and weighing 350 pounds, he suffered continually from ill-health, and from the rugged wild haunts of Alpine he drifted to various mining sections in the northern part of the State, finally locating in Los Angeles county in 1872, and shortly after was largely instrumental in developing the Silverado mining district in Orange county, where he was also Recorder, Justice of the Peace and postmaster; but as is too often the case, the mines did not prove of sufficient worth to warrant the investment of large capital and were abandoned. From there he went to San Jacinto and engaged in farming, starting a nursery in Diamond Valley and building him a beautiful home.

In December, 1886, he married an estimable Los Angeles woman, two children being born to them, one only now surviving. His unstinted hospitality, proverbial popularity and genial qualities, will cause him to be remembered long years hence by many a miner who, hungry and homeless, asked only to receive abundantly at his door, where the latch-string always hung upon the outside. He built up mining camps and "grub-staked" the occupants, endeavoring to develop the mineral resources of our State, and while his reward was only the consciousness of helping his fellow-man, some of our mines and miners owe him more than a debt of gratitude.

TEMESCAL TIN.—A dispatch from Pomona, says: Several weeks ago Congressman Bowers of this district fortified himself for his going to Congress, where the McKinley bill would be discussed almost daily, with an abundance of facts and particulars concerning the tin-mining industry in the Temescal mountains, and spent several weeks in visiting the mines and watching the operations of getting out ore and producing the block tin. He had published, at his own expense, 1000 pamphlets descriptive of the Temescal tin mines, the extent of the operations there and the plans and preparations the tin company has made for developing its magnificent property. These pamphlets are designed for distribution among inquiring and interested members of Congress, and are designed to answer every possible question on the subject of producing block tin in Southern California that a free-trader or opponent of the tin clause in the McKinley bill can ask. Congressman Bowers has also prepared for himself 500 small bricks of Temescal tin, and will distribute the bricks among the members of Congress. Each brick has the words "Temescal, California" stamped upon it. Mr. Bowers is now the only member of Congress representing a district where tin ore is mined and smelted.

DANIEL CARPENTER, one of the best-known mining men of Montana, dropped dead at Great Falls on the 4th inst. Mr. Carpenter was a brother of the late Senator Matt Carpenter of Wisconsin. He was an old-timer in Montana, having gone there about 20 years ago. He was the first man to discover silver in the Nehart district, which he made, locating on Carpenter creek, which is called after him.

MINING DIVIDENDS.—During November, 30 mining companies in the United States, which make public statements of their earnings, paid dividends to the amount of \$1,442,275, against \$1,421,875 in October. The total for the first eleven months of the year is \$15,519,871. This amount is far in excess of that paid in the same time in 1890, the total for the latter year being but \$13,743,478.

A Rock-Drilling Contest.

A match of this kind occurred at Denver, Colo., on Nov. 19, 20 and 21, 1891. It was quite a notable event to the miners of Colorado, and excited much simulation. Several counties sent their best men, and some enthusiastic superintendents allowed men their time, and in some cases even expenses. Several hundred miners came to Denver to the trial, and large bets were made on the results.

The rules were three-fourths inch steel, and not over four-pound hammers for single-hand work, and seven-eighths inch steel, and not over eight-pound hammers for double-hand work. Miners to furnish their own tools. Time of drilling was to be exactly 15 minutes. All holes were down holes. The rock selected was a very hard, compact variety of (Gunnison) Colorado granite.

The following prizes were offered by the Mining Congress managers:

FOR DOUBLE-HANDED DRILLING.	
First prize.....	\$500
Second prize.....	400
Third prize.....	300
Fourth prize.....	200
Fifth prize.....	100

FOR SINGLE-HANDED DRILLING.	
First prize.....	\$300
Second prize.....	200
Third prize.....	150
Fourth prize.....	100
Fifth prize.....	50

Special Prizes.

For Best Single-Hand Drilling—Solid silver cup, presented by Judeon Dynamite & Powder Company.

For Best Double-Hand Drilling—Silver sledge and pick, presented by Taylor & Rathvon.

For Second Best Single-Hand Drilling—\$500 insurance paid up for one year, \$10 a week indemnity, presented by Equitable Accident Insurance Co.

For Third Best Single-Hand Drilling—\$500 insurance paid up for one year, \$7.50 a week indemnity, presented by Equitable Accident Insurance Co.

The drilling took place in the evening by electric light, before an audience of at least 2000. All entries, excepting one, were from State of Colorado. Following is full list and score:

DOUBLE DRILLING.	
Page and Reagan, Butte City.....	15-16
Kennedy and Rinker, Leadville.....	21 12-16
Lindgreist and Fanner, San Juan.....	28 10-16
Mullins and Oates, Gilpin.....	28 2-16

O'Keefe and Dwyer, Leadville.....	25 8-16
Short and Manuel, Gilpin.....	25
Abeard and Lyons, Leadville.....	24 15-16
McCarthy and O'Connell, Hinsdale county.....	24 10-16
Yates and Yates, Boulder.....	21 14-16
Griffin and Griffin, Clear Creek county.....	23 8-16
Hill and Cummings, Ouray.....	23
Kelleher and Laughlin, Gilpin.....	22 6-16
McCloud and Ferguson, Clear Creek county.....	22 1-16
Hodges and Traylor, Leadville.....	21 14-16
Jones and Silbey, Dolores county.....	21 14-16
Lewis and Harvey, San Miguel.....	21 4-16
McNulty and Murphy, Aspen.....	21 4-16
Libby and Howe, Clear Creek county.....	21 2-16
Trezona and Waters, Aspen.....	20 14-16
Anderson and Shaw, Boulder.....	20
Epler and Smith Red Cliff.....	17 3-16
Kappeler and Wendish, Red Cliff.....	16 12-16

SINGLE DRILLING.	
D. L. Jones, Clear Creek county.....	13 11-16
William Shea, Boulder.....	17 4-16
Joseph Burns, Leadville.....	16 10-16
Thomas Burns, Leadville.....	16
N. Monach, Clear Creek county.....	15 8-16
G. E. Austin, Boulder.....	9 12-16
John Cullis, Denver.....	13 12-16
J. H. Williams, Gilpin.....	13 6-16
T. Oakes, Clear Creek county.....	13 4-16
S. Manual, Gilpin.....	12 14-16
M. Exchere, Gilpin.....	12 12-16
George Burns, Leadville.....	11 10-16
James C. Munn, Aspen.....	10 6-16
R. J. Lyons, Ouray.....	10 2-16
J. Lapland, Ouray.....	9 12-16
W. R. Martin, Boulder.....	9 10-16
James Manning, Ouray.....	8 10-16
E. R. Godsey, Boulder.....	8 1-16
James Stanton, Denver.....	2 8-16

It was somewhat galling to Colorado that Montana with one team should win the first prize, and the pill did not taste good, although it was paid for fairly and swallowed. So, on evening following, another trial took place, and two from best Colorado teams were combined to heat the record. Special prizes of \$250, \$150 and \$100 were given. The Butte City men decided not to compete in the second contest—giving a plea of not in condition. It was the safer way; also perhaps it was hard for victors to keep in condition and meet many old acquaintances on a holiday trip in a city like Denver. Below is the score of the last evening:

Abeard and Rinker, Leadville.....	31 6-16
O'Keefe and Dwyer, Leadville.....	28 10-16
Mullins and Oates, Gilpin.....	28 3-16
Lindgreist and Fanner, San Juan.....	27 4-16
McCarthy and O'Connell, Hinsdale.....	27 2-16
Short and Manuel, Gilpin.....	27
McCloud and Ferguson, Clear Creek.....	27
Cummings and Hill, Ouray.....	25 6-16

It should be said that two granite blocks were used at the first contest, and although they were from the same section, one was evidently harder than the other, and most of the shallow double-hand holes were drilled in it. Also it was placed edgewise of the grain, while the other was placed with the grains horizontal.

At the last trial, all holes were drilled in one rock.

Probably the records established here will stand for some time, as 31 6-16 inches for double hand and 18 11-16 inches for single hand work in 15 minutes is not easily surpassed.

Alkali—Its Causes and Cure.

[Condensed from an essay by PROF. E. W. HILGARD of the State University.]

I am aware that the question of reclaiming alkali lands, and repressing the increase of their area, has not thus far assumed, in South California, the prominence it has attained in some other portions of the State. The fact that the lands occupied and irrigated are so largely benches and even mesas, has prevented the trouble from arising from the presence of alkali from becoming so widely felt, albeit a great deal of pretty strong alkali land is to be found south of the Tehachapi, and much more of it will before long come within reach of irrigation. I therefore think it timely to bring this matter before this meeting, both in respect to the means of preventing damage by simple means adapted to the gravity of each case, and in order to explain to you the reasons why alkali soils may be regarded as being, intrinsically, among the richest lands within the State, capable of high and lasting production when properly dealt with.

The first point to be discussed, in considering the subject is,

"What is Alkali?"

The chemist will tell you that it consists of soluble compounds—salts—the basis of which is mainly soda, together with smaller amounts of potash, and usually a little lime and magnesia. When these salts exist in the soil to any very considerable extent, then their presence becomes manifested, in summer, by their appearance on the soil surface, in the shape of white crusts or crystals. These represent, mainly, the following compounds, each in its pure state: Sulphate of soda, or Glauber's salt, which you sometimes use as a medicine for cattle and horses; Chloride of Sodium, or common salt, which you know too well to require description; and last, but not least, Carbonate of Soda, or Sal soda—washing soda—with which you are almost equally familiar. With these predominant salts, which are nearly always present in varying proportions, here in much smaller amounts other salts highly important for vegetable nutriment namely: Sulphate of Potash, Phosphate of Soda, or lime, and very often Nitrate of Soda or Chili salt-peter; all ingredients of which the presence in commercial fertilizers determines their value, and which are of prime importance to plant growth. With these we find, usually, to a great or less extent, Epsom salts, or Sulphate of Magnesia, and a little Gypsum, or Sulphate of Lime. Next comes the question

How do These Alkali Salts get Into the Soil?

The reply is that all soils are formed from rocks in which these substances occur in various forms, by the combined chemical action of air and water, and by the mechanical pulverizing action of frost, flowing water and moving ice, or glaciers. The same alkali salts are formed everywhere in the world; but in countries having abundant rainfall they currently wash through the soil into country drainage, as formed: while in regions where rainfall is deficient, the scant moisture only carries them down a little way into the subsoil, from which they rise to the surface by the evaporation of the water, and are there accumulated at or near to the top of the soil. It is right there that nearly all the damage is done; the water in the depth of the soil is very rarely strong enough to hurt the roots of plants directly.

It follows from what I have said that all natural waters must contain alkali salts to a greater or less degree.

"How and Why Does Alkali Rise to the Surface?"

As I have said, it is surface evaporation that brings it up. The soil acts like a wick: and if you will take a lamp wick and plunge its lower end in salt water while exposing the upper end to the air, you will quickly see an "alkali crust" forming on the end. But you also know that different wicks will raise water or coal oil to different heights, according as they are closely woven or loose like candle-wicking. The close wick will raise the fluid higher in the end, but it will rise to its highest point more slowly than when you use the loose wicking. Just so in soils, the close ones will raise the soil water from a greater depth than will the loose sandy ones, but the latter will bring it up much quicker to the full height to which it can rise at all.

If alkali water should stand in a sandy soil at a depth of two feet, very little of it would evaporate at the surface and therefore alkali would show on the surface only slightly, or not at all, while from a clay soil having water, even at twice that depth, the evaporation would be brisk and continuous, and an alkali crust would promptly form. You know well from your experience that alkali is always worse on clay soils than on adjacent sandy ones. Beyond question the damage done by alkali, in at least nine cases out of ten, is due to accumulation at or near the surface. When we examine the soil of an alkali spot for its alkali contents, at various depths, we find five or six times as much in the first inch from the surface down as is contained in the bottom water, or at the depth of a few feet in the soil itself. The top crust is sometimes almost pure alkali salt, and it is no wonder that it should corrode the root-crown, and weaken or kill the plant. It obviously follows that the first requirement in preventing damage from alkali, is to prevent

surface evaporation as much as possible. The first condition in this regard is to lessen the formation of a surface crust. In other words, to keep the soil in deep, loose tilth, or else to mulch it. In either case, surface evaporation is reduced to the lowest point practically attainable. Evaporation through the leaves of plants—for instance, in an alfalfa field—brings up no alkali to hurt. More than half of the alkali land in this State that people are afraid to touch, requires no other remedy than thorough, deep tillage, maintained at all times. But, in bad cases, other means are required; and this leads us to consider which of the above salts is the most injurious.

Your experience tells you that the worst alkali is the "black." Now what is black alkali, and why is it so called?

Not, as some have imagined, because of its moral turpitude, but because it causes blackish-tinted puddles to stand on the ground and on evaporation leaves black rings around the margin of the pool. When we analyze such blackish water we find that its chief ingredient is carbonate of soda—soda-salt—and that the black tint is caused by the humus of soil, which it has the power to dissolve. This itself is a serious injury, for humus is one of the most important of soil ingredients; if held in solution, or washed away through the soil, the prodigious powers of the land are seriously impaired.

Here is a calcareous "adobe" soil wetted with pure water and dried. I throw it on the floor before you and it crumbles into a thousand crumbs. Here is a lump of the same soil wetted with soda-salt solution, and also dried. I throw it on the floor and you hear it strike like a brick-bat, and it breaks into two or three hard clods, which you can just scratch with your nails. You see the extreme importance of getting rid of the "black" part of the alkali in every case. This can be done by giving the soil a dressing of gypsum or land plaster.

Here is a solution of soda-salt: I pass it through a filter filled with black soil; you see the water that passes through is almost as black as ink, and we now have the same solution that you see in alkali puddles where it is "black." Had I time to finish this operation you would in the end find that the black soil turned gray or whitish—just as your alkali spots after the rain has washed out the color.

Now I add to this black water a quantity of powdered gypsum, and shake it up. We shall have to wait a little to see the action completed; but in the end you will see that the solution has become nearly or quite colorless, while the gypsum has turned dark from the precipitated humus. That is precisely the way it acts in the soil—it keeps the humus from being washed away, and above all, it converts the "black" alkali into "white," that is, the carbonate of soda has now been turned into sulphate of soda or glauber salt, which, as I first told you, is one of the chief ingredients of all alkali, and is quite bland as compared with the corrosive soda-salt. We have thus taken the cutting edge off the alkali, and in thousands of cases, this change, with thorough tillage, is all that is needed to do away with all damage from alkali. The amount of plaster to be used per acre, depends, of course, upon the strength of the salts in the soil. Sometimes 500 pounds per acre will be enough, then, again, it may take a ton or even more, and after that, perhaps, an annual dose of from one to three hundred pounds per acre, until the carbonate of soda is completely destroyed.

You may ask how you are to know by an easy test that the carbonate of soda is destroyed. Here it is. This is a paper tinted with a solution of litmus, a preparation you can find in most drug stores; and if not, they should be made to keep it for you. Any acid—vinegar will do—turns the blue solution red; add soda or potash (ash lye) to the red solution and the smallest amount will instantly turn it blue. So with this paper, as you see, I can change the color at will, and if the red paper turns blue when I touch the alkali water, or the wetted soil, I know at once that there is black alkali there, even if it be too little to show by black rings in the mud puddles. Any child can make this test; but you must understand that the change to blue should be prompt. Almost any California soil will in the long run turn litmus paper blue, because all our soils contain considerable lime, which acts like the soda-salt, but much more slowly.

There is one virtue possessed by gypsum that I have not alluded to; it is that when (as is frequently the case) the alkali contains phosphate in solution, these phosphates are fixed and retained in the soil, just as is done in the case of humus; whereas, otherwise, every rain and every irrigation would wash them out more or less.

But if after transforming your black alkali into white and practicing thorough tillage, you still find your trees or vines under stress, there is but one remedy—a radical one, which rides you of all alkali, black or white, for good. That remedy is underdrainage. It is the remedy we have lately found it necessary to recommend for some of your parks where white alkali occurs very abundantly at some points. That this is so is self-evident from the fact that in countries having heavy rainfall there is no alkali in the soils. What prevents it is the natural underdrainage, through the soil into the country drainage. Where this does not exist naturally, it can be established artificially by first laying drain tiles, and then flooding your land until the last vestige of alkali is washed out. Experience fully and amply confirms this

conclusion; but experience has also abundantly shown that alkali cannot be washed off the land by abundant flooding without drainage. All you do in that case is to put the salts down into the subsoil, from which they will rise again at the first chance, and your water and trouble will have been wasted. What you sometimes can effectively do in very bad cases, is to scrape off the alkali crust, bodily, and haul it where it will be carried off by the streams—or, possibly, by the ditches, for the benefit of your neighbor below. Such things have happened.

Placer County Miners.

Delegates to County and State Conventions.

In the PRESS of last week was published an account of the proceedings of the Miners' Convention in Placer county, but lack of space prevented publication of the names of committees and delegates. As stated in the report referred to, Hon. J. H. Neff, of Colfax, called the Convention to order, and he was elected Chairman, on motion of Hon. J. B. Patterson. The Secretaries were J. A. Filcher (of the Placer Herald) and T. B. Everett—the two gentlemen who were the originators of the plan to form a miners' association.

On motion of J. B. Hobson a Committee of five was appointed on Credentials by the Chair, as follows: J. B. Hobson, J. F. Brown, W. D. Perkins, J. C. Boggs and Hon. P. McHale.

On motion of Hon. J. B. Patterson a Committee of five on Permanent Organization and Order of Business was appointed by the Chair, as follows: Hon. J. B. Patterson, O. J. Spencer, J. M. Barney, Wm. Nichols, Jr., and Hon. A. P. Hall.

On motion a Committee of five on Resolutions was appointed by the Chair, as follows: Hon. J. A. Filcher, Hon. Geo. H. Colby, W. B. Thorpe, Allen Towle and Frank L. Sanders.

A committee was appointed to draft laws and rules for the government of the Permanent Association, as follows: J. B. Patterson, S. M. Sprague, T. B. Harper, W. H. Grenell and Hon. P. McHale.

The Committee on Credentials reported the following delegates to the Convention and entitled to seats:

Auburn Precinct, No. 1.—J. Hamilton, J. A. Filcher, D. W. Spear, P. McHale, B. F. Hartley.

Auburn Precinct, No. 2.—John Spaulding (R. F. Burns, proxy), J. B. Patterson, J. B. Hobson, E. C. Uren, T. B. Everett.

Bath.—W. H. Grenell, Judson Wheeler, A. Breeze, T. N. Hosmer, M. Dougherty.

Todd's Valley.—T. Blaoohard, John Schippmann, H. S. Bryan, Geo. Moeller, H. Newman.

McKinsley.—A. C. Gilbert, Wilson Carey, St. Clair Nye, G. R. Cowen, H. T. Power.

Ophir.—James Butts, Sam Kaler, Geo. L. Smith, Geo. Taylor, Al Shurtliff.

Forest Hill.—I. Bowman, Wm. Dodge Jr., Jas. Creighton, Wm. R. R. J. B. Seller.

Michigan Bluff.—E. Poliska, C. P. Udell (proxy, R. L. Dunn), A. Miller, E. O'Connell, Wm. Mair.

Iowa Hill.—J. F. Brown, Jas. Gleason, S. M. Sprague, J. O. Jones, O. J. Spencer.

Sunny South.—R. M. Sparks, Jas. Tickell, M. Holt, J. W. Eggleston, F. Howell.

Rock Creek.—A. O. Bell, E. C. Bellows, J. E. Bisset, Fred Dependence, F. Roberts.

Newcastle.—Dr. M. Schnabel, W. B. Thorpe, J. C. Boggs, A. S. Whitmore, E. L. Hubbard.

Yankee Jims.—J. N. F. ndley, G. S. Sanborn, J. L. Welcker, Harry F. Adams, Thos. Gilbert.

Rocklin.—Dana Perkins, Wm. Harlow, M. Yarrhough, D. Grant, J. L. Levlson, Orrin Rice, C. Clough, F. Hull.

Damasco.—C. F. Hoffman, A. B. Cammell, Applegate.—G. C. Hephurn, F. Rotter, F. E. Colburn, G. D. Wyman, A. H. Applegate.

Gold Run.—E. G. Herrmann, Jason Brink, Wm. Doolittle, James Stewart, E. A. Moody.

Colfax.—Hon. J. H. Neff, A. G. Bell, W. P. Perkins, J. B. Whitcomb, H. Simons.

Dutch Flat.—Dr. Noble Martin, Hon. G. H. Colby, J. M. Barney, Jas. L. Gould, Wm. Nicholls Jr.

Loomis.—E. W. Maclin, Peter Snyder, W. H. Tadebury, Peter Mong, F. N. Cook.

Lincoln.—T. B. Harper, G. Gray, Geo. Felis, C. Kennedy, F. L. Sanders.

Alta.—Allen Towle, A. N. Jones, A. Roger, H. V. Martin.

Roseville.—W. A. Thomas, J. R. Dyer, E. Panabaker, G. K. Kirby, G. N. Harmon.

Allens.—E. L. Hawk, Geo. W. Prosser, D. L. Allee, F. Martin, W. C. Alford.

Junction House.—C. A. Greenfield, A. Armbruster, W. H. Parkman, J. Sheppard, W. J. Robinson.

Butcher Ranch.—E. McKinstrey, W. R. Davis, Geo. Maither, E. B. Gilhert.

Penryn.—A. P. Hall, A. A. Smith.

At Large.—Chas. G. Yale of San Francisco, Hon. T. C. Hooking of Grass Valley, C. L. Cain of Placerville, Pat Campbell of Smartsville, M. J. Ferrell of Grass Valley, H. A. McCreaney of Lake county, R. F. Rooney of Auburn, Amos Stevens of Colfax and F. E. Cannon, John Papa, W. R. Morton, Garrett Booth, E. G. Spencer of Iowa Hill.

It was moved and carried that the Convention proceed to elect thereby delegates to which Placer will be entitled under the call in the State Convention.

On motion of Mr. Filcher, it was decided to select six delegates to the State Convention

from each of the five Supervisor districts of the county, and the Convention took a short recess to allow the representatives from the various Supervisor districts to select their candidates.

On the reassembling of the Convention, the following names were submitted for ratification as delegates and alternate delegates to the State Miners' Convention:

DISTRICT ONE.

Delegates.	Alternates.
E. L. Hawk	
Wm. Thomas	
H. Cashmer	
T. B. Harper	
G. Gray	
F. L. Sanders	

DISTRICT TWO.

Delegates.	Alternates.
Jas. Winn	Geo. Taylor
Otto Walter	Geo. B. Hewes
W. B. Thorpe	Thos. Thorpe
J. G. Boggs	H. F. Albes
M. Schnabel	A. P. Hall
Sam'l Laird	Wm. Tadebury

DISTRICT THREE.

Delegates.	Alternates.
J. B. Patterson	D. W. Spear
J. A. Filcher	T. J. Nichols
J. B. Hobson	E. C. Uren
John Spaulding	R. F. Burns
Jo Hamilton	H. H. Rhomond
B. F. Hartley	R. L. Donn

DISTRICT FOUR.

Delegates.	Alternates.
J. H. Neff	J. H. Barry
Allen Towle	H. V. Martin
Dr. N. Martin	Wm. Nicholls
J. Y. Thomas	E. G. Hermann
A. G. Bell	Amos Stevens
G. N. Colby	J. L. Gould

DISTRICT FIVE.

Delegates.	Alternates.
C. F. Hoffman	A. Breeze
S. M. Sprague	Wm. Muir
H. G. Power	M. Gleason
O. J. Spencer	E. B. Campbell
E. McKinstrey	W. R. Morton
G. R. Gown	

Upon motion, a committee of five was appointed to draft a call for a State Convention, the chair appointing the following as such committee: W. B. Thorpe, Chairman; Allen Towle, Wm. Grinnell, J. A. Filcher and W. D. Perkins. There were subsequently added to such committee the names of Hon. T. C. Hooking of Nevada, C. L. Cain of El Dorado, H. A. McCreaney of Lake, C. G. Yale of San Francisco and J. B. Hobson and P. McHale of Placer.

The above committee was excused for half an hour to prepare its report, and during the interim the Convention resolved to form a permanent Placer County Miners' Association, and a committee consisting of J. B. Patterson, S. M. Sprague, T. B. Harper, W. H. Grinnell and P. McHale was appointed to draft suitable constitution and by-laws for the government of the association.

A committee was also appointed to prepare an address to the people of California relative to the present condition of the mining industry, stating the causes of its depression and explaining the objects sought to be obtained by the proposed State Convention. The committee consists of the following named gentlemen: Russell L. Dunn, Chairman; Dr. M. Schnabel, John M. Fritwell, Geo. H. Colby, J. A. Hobson, J. A. Filcher, Chas. G. Yale, J. H. Neff, Dr. N. Martin, D. W. Spear, and Amos Stevens.

A permanent Committee on Finance was appointed, consisting of J. B. Hobson, Chairman; H. V. Martin, Dr. M. Schnabel, J. O. Boggs and D. W. Spear.

The following Executive Committee was chosen: J. H. Neff, J. B. Hobson, John Spaulding, C. G. Yale, B. F. Hartley; Secretary, T. B. Everett, Auburn, Placer Co.

The resolutions and call for State Convention were published in the MINING AND SCIENTIFIC PRESS of last week, and the address will be found in another column of this issue.

An Anti-Debris Convention.

Associated press dispatches, dated Sacramento, December 4th, are as follows: What may prove to be the opening gun of renewed hostilities between the mountain and valley people—the old anti-sloken fight—was fired here to-day. A convention of Sacramento county farmers was held at the courthouse this afternoon to devise means for shutting down all the hydraulic mines. Ex-Senator Routier was chosen chairman. He said that the miners appeared to be defiant of the law. He thought the farmers ought to form an association to preserve their rights.

Attorney Robert T. Devlin, who is employed by Sacramento county to look after the sloken matters, said that he had no doubt there was a determined effort on foot to resume hydraulic mining. He referred to the Denver and Auburn meetings of the miners, and said the only way to meet this effort is by organization. Congress meets next Monday. That body has declared it is a crime to place upon the banks of a navigable stream any matter that can get into the stream to its detriment. In other words Congress has favored the valley.

The attorney advised the farmers to employ men who will not be known as agents of the anti-debris association to secure evidence in the mines. It is idle to bring suits that will only result in non-suits. The hydraulic miners first fought in the courts, but now that they have been defeated there, they are pursuing

different tactics. The valley people ought to organize and send two trusted men to get the required evidence. Then suits will be brought. No doubt unlawful mining will be resumed as soon as there is water to operate. Chairman Routier insisted that immediate co-operation by the farmers was needed. He thought the supervisors ought to send men to the mines who could get the necessary information.

Mr. Devlin said the supervisors complained of the expense. Several members said they thought it would be cheaper to hire agents than to build levees higher every year, as would be necessary if hydraulic mining was continued. Mr. Devlin said that farmers have been very generous with hydraulic miners. When it was claimed that brush dams would hold back debris, the farmers waited three years for a test. The straight question for the valley is, shall hydraulic mining go on or shall it stop? Every man who owns a home in the valley is interested. The law-breakers claim that there should be found some way to get on the gold without injuring the property of others, but it is their duty to devise that way, if such there be.

The speaker urged the importance of organization. "This is not a fight against mining, but a contest for our homes," he said. "Men who are chosen to go into the mountains must be men who are fearless and honest. If we have men enough, we can stop all mining on the American river."

It was ordered that a committee of two from each supervisorial district should be appointed to devise a plan of campaign. The chairman promised to announce the names of the committee Monday, and the meeting adjourned to meet at 1 P. M. Wednesday, December 9th.

The Mines of Jaho.

John Gildea returned to this city last week from China, where for the past year he has been in the employ of the Chinese Government at the mines of Jaho.

"Jaho is the ancient capital of Mongolia," said Mr. Gildea, "and is about 300 miles inland. On the way to the mines we rode horseback all the distance and passed through many villages, the inhabitants of which had never seen a white man. In some places the women and children would double-lock the doors and hide; while the men would follow us wherever we went out of curiosity. They didn't understand how we came to be without queues, and were mystified at our appearance and dress, but no attempt was made to molest us."

"The Jaho mines are extensive, and consist of a lode of 60 miles long and 100 feet wide. The ore is silver-bearing, but will not average more than \$12 a ton. About 1000 coolies are on the pay-roll, and each one gets about \$5 50 a month in Mexican money. They are the greatest thieves I ever saw, and many of them, just for the love of stealing, would steal a piece of ore perhaps not worth more than five cents, though if the pilferer was caught, he would lose his pay and be hamboozed beside. This punishment is given by striking the man on the muscles of his bare legs and often so severely that the flesh is cut through to the bone."

"Much of the mining machinery is first class, and was sent from this State, and I doubt if any mine in the United States is better equipped with modern machinery than the mines of Jaho."

The 11 Americans who are in charge of the mines left San Francisco about a year ago, and are Superintendent Darlington, Head Furnace-man Dexter, Mill Superintendent Myrick, Professor of Mineralogy Crabtree, Chief Engineer O'Day, Foreman O'Day and Ryan, and Shift Bosses Jandy, O'Toole and Gildea.

Sampling Ores.

The Black Hills Times in speaking of the Aurora Smelter, says:

Judge S. P. Romans returned yesterday from a brief visit to the Illinois plant, which he found to be one of the most complete and best arranged works in the country, their method of treating and sampling ores being superior to that in vogue at Omaha. In unloading a car of ore, every sixth barrowful is put aside. It is then crushed and pulverized, taken into another room, where it is thoroughly mixed and quartered; thence to another room, where the sample is still further reduced in size, and three bottles filled with the pulp and sealed. From this room they go to the assay department, each bottle being labeled "Lot No.—." The assayer takes a certain number of grammes from each, and from the three assays the value of the ore is obtained. A straight charge of \$10 per ton is made for treatment, the mine getting full pay for all the gold, silver and lead contained in the ore. At the Omaha works, ores containing less than a certain amount of silver do not get any credit for that metal, so that the only additional cost between the two points is that of \$1.50 per ton for transportation. The Aurora plant has a capacity of about 250 tons per day, which can be pushed if necessary to 300 tons. Vice-President Van Arsdale of the company made it very pleasant for the Black Hill delegation during their visit, and stated that his plant would receive at any time 25 to 30 carloads of Black Hill ores. He was surprised to hear that information had been received in Deadwood that his company had declined to receive the special ore train of 22 cars lately forwarded.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

THE ASTORIA.—Amador Ledger, Dec. 5: The Astoria, Hollywood and Middle Bar claims, all close neighbors at the southern extremity of the mineral belt in this county, and all organized into independent corporations for the purpose of stock-dealing in New York, are in a state of sound response, as far as the development of their mineral resources is concerned. They are unpatented mines, and for years only sufficient work has been done to satisfy the United States laws. The surface works and underground developments are not worth mentioning. People hereabout pay no attention to the frivolous operations which have distinguished these claims; they cut no figure whatever in the mineral development of this region. It has seemed to us all along that the object is to work off stock on the over-credulous in New York rather than an honest endeavor to search for mineral treasures here.

KENNEDY.—At the Kennedy they are engaged in sinking the sump at the 1550 level. Sinking will be finished by the end of this month. This will give 200 feet of new ground to operate in, namely, at the 1450 and 1550 levels, neither of which has been touched as yet. The monthly cleanup was made this week. Although it falls far short of the big yields a few months back, when from \$30,000 to \$40,000 was disbursed in dividends per month, still it was sufficient to leave a handsome sum to be divided among the shareholders after paying all expenses. The shaft of the South Eureka is down about 300 feet. Considerable quantities of quartz are met with, but not of a paying grade. Sinking will proceed until a depth of 500 feet has been reached, when drifting for the ledge will be in order. The new hoisting works at the Clinton Consolidated mine are running satisfactorily. The mill has also been kept running steadily since the repairing of the ditch.

BUNKER HILL.—Cor, Amador Ledger, Nov. 5: The Bunker Hill mine is still idle, and as yet the employees have received no encouragement from the company. It will be remembered that the company agreed to settle up the back pay within five months from July 1st, and also to pay the men once a month for labor performed within the five months. The time expired the first instant, and the miners are about two months further behind now with their wages than on July 1st. The town is very dull at present, as a number of men are thrown out of employment.

OLETA.—The new mine will start up in a few days. The engine has come, and will be erected as soon as possible. The boarding-house and other buildings are almost finished, and will soon start up in full blast.

Butte.

BROWN'S HILL MINES.—Oroville New Era, Dec. 4: A great deal has been said about the rich strike made at Brown's Hill by the Wheeler Bros., and the outlook now is that they have a perfect bonanza in sight. In conversation with a New Era reporter, James Wheeler, one of the owners of the mine, stated that they have four men at work now, and they are averaging \$20 per day to the pick. It has been said by some that the boys have struck merely a quartz pocket, but Mr. Wheeler tells us it is an 80-foot channel from 3 to 5 feet in depth, containing large washed boulders, one of which it took them 26 days to blast through, which explodes the theory of a pocket. Mr. Wheeler brought down some samples of the gravel with him that is very rich. He also brought some samples of quartz from the ledge owned by Paul Willott, at the same place. Specimens of the quartz taken at random assay as high as \$100 to the ton. Mr. Wheeler also has a ledge located which prospects very rich. Brown's Hill bids fair to become one of the liveliest mining camps in the State next season. Five different companies will operate there next season. A good wagon road has been built into the mine.

El Dorado.

RICH GRAVEL.—El Dorado Republican, Dec. 3: A strike of rich gravel was made in the Franklin mine, near Placerville, last Monday. For some time the owners, Geo. Allen, Len Hart, A. S. Tokey and others, have been running a tunnel about 400 feet in length to prospect, ventilate and drain the mine. Their efforts have been rewarded by the discovery of a rich body of gravel, which is believed to be extensive and which promises remunerative work for some time.

SALE.—We learn that Geo. Patrick has purchased a one-half interest in the Schultz & Bombach mine, north of Coloma, the price being \$200. The mine will be under the management of Schultz & Patrick, Mr. Bombach having nothing further to do with it.

Humboldt.

MAPLE CREEK.—Blue Lake Advocate, Dec. 5: Mrs. Preston was in town Wednesday on the way to the Bay with a load of coal from the Maple Creek mine. The shaft is now about 50 feet deep and the vein has increased in size until it is at present 6½ feet in thickness. The quality of coal is good and every test of its merit as fuel has proved entirely satisfactory. As all indications point to an inexhaustible supply on Maple creek, the prospect of benefit to the county grows steadily brighter. Mrs. Preston informs us that she has been offered \$40,000 for her mine on the creek, but she assures us that she has no intention of parting with it at those figures. Work in the shaft will go right ahead, though the situation is such that only a small crew can be employed. The bottom of the shaft is now one solid mass of coal, and it is thought that the dimensions of the vein are really much greater than those of the shaft.

DEPOSITS OF KAOLIN.—Field Assistant Watts of the State Mining Bureau, recently in this county, took from the ranch of A. J. Moore, on Maple Creek, a quantity of the peculiar clay to be found in that section. We understand that analysis proves the deposit to be kaolin. Kaolin is that variety of clay which is used in the manufacture of porcelain.

Nevada.

MILL STARTED.—Grass Valley Telegraph, Dec. 7: For the past week the mill at the Idaho mine

has been closed down and all hands therein laid off. This was done because the shaft from the 1800 to the 1900 level was in such a condition that it had to be repaired. The shaft has now been placed in good repair and the mill resumed its work this morning.

MALTMAN REDUCTION WORKS.—Nevada Transcript, Dec. 8: Fred W. Bost, one of the most experienced and skillful ore workers in the county is about to start up the Maltman Reduction Works on the lower Grass Valley road, which have been idle recently on account of the failure of Mr. Maltman's health. Mr. Bost is putting the machinery in thorough repair, getting in fuel and making other necessary preliminary arrangements, and will soon be prepared to reduce ores of all kinds. These works have for years had the merited reputation of being among the best on the coast.

THE FEDERAL LOAN.—The Federal Loan with its five stamps continues to turn out more than enough gold to pay its way and the stockholders are consequently as well satisfied with the world as ever. Two large bars of bullion were sent to San Francisco last week, and quite recently about 100 tons of sulphurets that will give close to \$150 a ton, judging from the assays that have been made, were shipped to the Globe Works in Denver, where they will be reduced.

A PROSPECTIVE BONANZA.—The development of the Craig & McKenzie gravel claim is being pushed, and many old drift miners, who have examined it, are of the opinion that it will prove a bonanza, when opened up so as to give room for a full force of workmen.

A PIETY HILL PRODUCER.—J. J. Meacham and Luck Voyce, who are working a ledge in the former's house lot on Piety hill, continue to take out rich ore. Some found a few days ago pans out about \$200 a ton in free gold. The claim is being developed as fast as it can be with the limited facilities at hand.

BUSY CUSTOM MILLS.—There is much prospecting going on all around the city. The Nevada Co. and Locklin custom mills keep their stamps dropping prettily steadily on various lots of ore, and it is pleasing to know that most of the ore being milled is giving profitable returns.

LOOKING AT A MILL.—The Harmony is hoisting good gravel right along. Supt. Hothersoll and Millwright Ostott went to You Bet, to-day, to take a look at Judge Brown's ten-stamp mill, and the company will soon buy and put on their claim that or some other similar piece of machinery. Everything indicates that the only way to get near all the gold out of the gravel is to crush it.

THE CHAMPION.—The Champion is running its 15 stamps and paying well. One of the handsomest bars ever seen in the district was made at the mine last week.

THE MOUNTAINEER.—The Mountaineer also has a full crew of men at work. The mine is another of the stand-bys of Nevada City. It has been paying ever since the latter seventies, and has not yet reached the acme of its possibilities.

THE MANZANITA.—At the Manzanita the tunnel from the bottom of the 225-foot incline is in 400 feet and going ahead toward the channel at the rate of 30 feet a week, 7 men being employed. It is estimated that the channel will be entered within 700 feet.

WEST HARMONY.—At the West Harmony nothing but repair work has been going on since last Friday, when the snow and cold weather blocked the Central House ditch. The water will not, even under the most favorable circumstances, be running again till the latter part of this week. The company has a steam engine on the ground, and will get it in shape the next few days to operate the hoisting and pumping rig when the water supply is short.

PEABODY MINM.—Grass Valley Telegraph, Dec. 3: The Peabody mine is looking well enough to satisfy the owners. The very rich specimens that came out last week, and which created an excitement in mining circles, are not all that is to be found in the mine. This afternoon a portion of the ledge below the 300 level was taken up, and the ore is rich, almost but not quite as rich as that that came out several days ago, and which was deposited in bank the same as bullion. The ledge on the bottom is over a foot in thickness. The shaft is being put down, with all speed, for the 700 level.

THE WYOMING MINE.—The Wyoming mine is in Boston Ravine, on the east side of Wolf creek, near the residence of Patrick Riley. There is a fine ledge at the bottom of the shaft at the depth of about 30 feet. The ore taken out to-day showed well in mineral, and some of it was very rich in free gold. The mine shows most excellently well for the depth attained.

W. Y. O. D. MINE.—Grass Valley Union, Dec. 5: The 800 level of the W. Y. O. D. mine is opening out in fine shape, and shows that the pay chute is lengthening on the veins as depth is obtained. The ore is of high-grade, and the vein occupies the whole width of the drift on that level. The shaft is also being sunk for the 900-foot level. The mill is for the present kept going with the ore that is stopped out between the 6th and 7th levels, while there is on the dump, which was accumulated while the new mill was being built, 400 tons of ore, all of which will yield profitably. Since the new ten-stamp mill started up, the clean-ups have been very profitable, and by the first of the year all of the new improvements will be paid for out of the product of the mine, and soon thereafter the payment of dividends will be resumed. There are 50 men employed about the mine and mill, and the company disburses monthly \$5000 for labor and supplies. The W. Y. O. D., from its present output, and reserves of ore in sight, is now entitled to rank with any mine in the district.

WASHINGTON DISTRICT MINES.—Transcript, Dec. 3: F. L. Cooke of Maybort, who some time ago bonded the Governor Morton mine, found some good ore, but not sufficient to justify him in closing the trade when the bond expired. He has therefore obtained an extension of 60 days, and before that period ends will have the ledge opened up so he can determine its prospective value closely. Owing to the recent development of the ledge in the lower tunnel of the German mine, giving backs of 258 feet and a large body of good quartz, a mill will be constructed on the claim as soon as Supt. Cooley can have the machinery hauled in. He goes up to the mine this week to push the underground work ahead and put everything in readiness for taking out ore,

Plumas.

GREEN MOUNTAIN MINE.—Bulletin, Dec. 3: On Thursday of last week, we made a short visit to the Green Mountain mine, owned and operated by G. P. Cornell, and superintended by A. R. Bidwell. It was a pleasure to note the many improvements which had been made in and about the mine, and the activity manifest on all sides. Needed repairs have been completed on the mill, on the boarding-house and other buildings. A new and substantial cellar for storing vegetables and fruits has been added. Thirty stamps are running on ore which pays a good profit. Superintendent Bidwell is pushing development work in all directions. Thirty men are employed and they are kept busy attending to their various duties. This mine has a most beautiful location on the side of the mountain overlooking Indian valley. The Green Mountain mill is run by water under a great pressure, furnished from the Round Valley reservoir, whose ditches and pipes are in better condition than ever before. The main tunnel is in the mountain over a mile, and without a crosscut of any consequence. The country on either side of this tunnel, therefore, is practically unexplored. The Cherokee group of mines, beyond the face of the main tunnel, is under the same control as the Green Mountain, and through this tunnel they and others can be tapped at great depth.

San Bernardino.

MORE IMPORTANT.—San Bernardino Kaleido scope: The mining interests of this county are becoming more important every year, and it will not be long until the great desert country with all its vast expanse of sand and barren hills, will be as valuable as the fruitful valleys on this side of the mountains. From all parts of the county comes news of extensive work in prospecting rich-looking claims, and we hope it will continue until the mineral regions will be a source of revenue to the county and to the men who endure such great hardships in hunting for the hidden treasures. The Rose mine in Lone valley, recently purchased by a Riverside syndicate for \$30,000, is being rapidly developed and a large force of men is employed. It promises to be a very rich mine, and other prospects in the near vicinity now being worked on are looking very favorable. T. F. Chapman, the gentleman who purchased the Sidewinder mine and mill at Victor of F. A. Urban, has shipped two good-sized gold bricks to this city within the past month, and has now gone to Oakland to purchase additional machinery for his mill. He already has ten stamps in full operation, but the capacity is not sufficient for the output of the mine. The ore is not free milling, only one-third being free gold, and the balance, concentrates, the latter being shipped to the Selby Smelting Works at San Francisco, for reduction, a carload now being ready for shipment. The ore averages \$35 per ton and about 20 tons per day is produced. About 30 men are employed at the mill and mine, and with every foot of work the ore looks better.

Shasta.

TEXAS CON.—Shasta Democrat, Dec. 2: Twenty stamps are now in operation on the Texas Consolidated mine, Old Diggins. This is said to be the most substantial and best equipped milling plant in this part of the State, and now Mr. Hart proposes to put up a chlorinating plant as an addition to the mill.

A NEW MILL.—Wm. P. Miller and Fred Grotefend, owners of the Oro Fino mine, in Lower Spring district, have concluded to put up a ten-stamp mill on the river at a point a few hundred yards below Middle creek, and now have men at work leveling off the foundation. The plant will be complete with modern improvements and four Triumph concentrators.

GLADSTONE.—Within the past week big developments were made in the Gladstone mine. For some time the vein in the lower level has averaged from 10 to 13 feet in width. A few days ago the vein at this point widened out to 30 feet, all of it being good milling ore, and three feet of which is fairly speckled with coarse gold, a large sample of which can be seen at the bank of Shasta county. The Gladstone is proving to be one of the biggest mines on the coast.

BULLYCHOOP.—R. G. Hart, Sr., has put a gang of men to work on the Bullychoop mines, the property lately incorporated. This winter he will clean out the old works and do some new development work, and next spring will put up a crushing and chlorinating plant. He has been experimenting in a small way at the Texas Consolidated with the heavy sulphurets of Bullychoop with very satisfactory results, and knows now just what kind of a plant is needed to work the refractory ores of that group of mines. It will not be many months before Mr. Hart will have 20 or more stamps with a large chlorinating plant at work on Bullychoop.

BONDED CLAIMS.—Shasta Courier, Dec. 5: The syndicate of Sacramento and San Francisco men, who recently bonded Penrose & Gruber's mine for \$10,000, have eight or ten men here doing assessment work on the ledges owned by them. Besides the Penrose & Gruber mine, which is situated at the mouth of Gambler's Gulch, just out of town, this company has secured control of other locations within a mile, east and south of Shasta.

Sierra.

THE GIBRALTAR.—Mt. Messenger, Dec. 5: Gravel has been found in the Gibraltar drift claim, situated above the Red Oak and not very far from the Four Hills. An upraise was made from the tunnel, and at a height of 60 feet very good looking gravel was found, which contained gold. Further explorations will be made as rapidly as possible.

GOOD CLEANUPS.—Dave Vega of San Francisco, brother-in-law of Fred Morris, Supt. of the Tecumseh (late Marguerite) quartz mine, called on us Monday, and reported 30 men working there and 20 stamps crushing ore. Two good cleanups have been made.

Siskiyou.

PAID HANDSOMELY.—Yreka Journal, Dec. 2: The Cherry creek ledge, extending from Greenhorn creek to Cherry creek on Deadwood mountain, paid handsomely from last crushing made. The ledge is nearly two feet wide, the quartz being hauled to Diggle's arastra at Deadwood for crushing. Mr. Ironside, who is superintending the work, and owner of the claim, has bought out his partner, James Wheeler, having realized sufficient money, after paying \$2.50 a ton for crushing, to meet the amount for which the half interest was bonded to him some time ago. Barnes & Peters are also finding some

good paying quartz ledges on Deadwood mountain divide, between Greenhorn and Cherry creeks, and expect to develop them during the coming winter toward realizing rich paying property next spring.

CINNABAR.—The cinnabar miners on the West Fork of Beaver creek, Siskiyou mountain, have shut down the furnaces and will devote their time in drifting to find a permanent ledge. Instead of finding a mountain of cinnabar, as at first supposed, the clay adjoining the float cinnabar contains no quicksilver, hence the change in operations. No doubt a rich ledge or rich chimneys exist in the vicinity, just as rich quartz ledges do in the vicinity of rich pockets, but they ought to be located first. A couple of experienced quicksilver miners have been sent to the mine by the company to assist in development, who say the indications are excellent for finding extensive lodes of cinnabar.

BLUE GRAVEL.—Lee, Lash & Co. are still sinking their new shaft at Greenhorn, being obliged to go much deeper than expected in reaching bed rock, for purpose of draining the blue gravel, but they will soon be able to commence drifting and breasting out again to better advantage. When the pump is set in the bottom of this new shaft, they can work a large area of ground, known to positively contain rich blue gravel.

Tuolumne.

PROPOSED REDUCTION WORKS.—Union Democrat, Dec. 5: Col. Caleb Dorsey of Oakdale arrived in Sonora Monday, on his way to his mining property situated on the Stanislaus river in this county. Col. Dorsey contemplates the early erection of reduction works on the property, which is regarded as very valuable by mining men. The ore is of unusually high grade in free gold, and the two veins of which the property consists are strong and well defined. The water of the river will be utilized for motive power, and the cost of mining and milling reduced to the minimum.

BADGER.—The purchase price of the Badger mine, held under bond, has been paid to Messrs. Yancey & Martin, and it is now the property of Messrs. Palmer, Ellis & Tryon of Gilroy, with Mr. George Stayton in charge as superintendent. Mr. F. M. Johnson of San Francisco arrived in Sonora four days ago to inspect the mine for parties who may purchase it from the new owners. Mr. John Maxwell, resident manager of the Bellevue mine, returned to the mine after an absence of several days, having been engaged in the examination of certain mining property situated in another county. Mr. A. B. Cruikshank of the Mary Ellen mine, the mill on which was lately burnt, has taken charge of a mine near Big Oak Flat for Eastern parties. The Mary Ellen mine is now under negotiation for sale to parties in the East.

Yuba.

SMARTSVILLE GRAVEL MINES.—Nevada Transcript, Dec. 5: James Sneed and a party of Marysville capitalists were at Smartsville Sunday. It is said the result will probably be a new mining enterprise. C. F. Ayer has discharged about one-half of the force in the old Wheaton mine for a few weeks, until the drain tunnel, which is being pushed ahead as rapidly as possible, is completed. The persons working the old Ayer mine in Mooney Flat and the Pinch Back mine, also in Mooney Flat, are taking out some very rich dirt.

NEVADA.

Washoe District.

CON. CAL. AND VA.—Chronicle, Dec. 5: There has been extracted from all parts of the mine during the week 4491 1800-2000 tons of ore, of which 62 160-2000 tons were shipped to the Morgan mill and 1429 1040-2000 tons to the Eureka mill. The average assay value of all of the ore worked at these two mills during the week was \$23.75 per ton. The Morgan mill was stopped a few days on account of an accident to its engine, and the Eureka mill is now running in place of it.

OPHIR.—1465 level—Have continued our prospecting work in the openings leading from the point where the upraise from the sill floor of this level connected with the drift runs west from the winze 122 feet below the sill floor of the 1300 level, and have extracted therefrom and raised to the surface during the week 42 tons of ore, the average assay value of which is \$18.70 per ton.

MEXICAN.—On the 1465 level, the winze started at the end of the crosscut run west from the main north lateral drift at a point near the south boundary line of the mine, 132 feet in, has been sunk 14 feet; total depth, 59 feet; in porphyry carrying lines of quartz.

SIERRA NEVADA.—West crosscut No. 1 from the northwest drift, 630 level, 571 feet from the shaft, advanced a total distance of 1368 feet.

UNION SHAFT.—West drift, 900 level, is out west of shaft a distance of 1360 feet; face in porphyry.

SILVER HILL.—The northwest drift, 50 level, is out from the shaft 380 feet; face in porphyry. The south crosscut 160 level is out from the winze 820 feet; face in hard porphyry.

BULLION.—The joint crosscut, 1300 level, is advanced a total length of 182 feet; face in porphyry and clay. South drift from Potosi winze, 1400 level, is advanced a total of 266 feet; face in porphyry.

ANDES.—On 420 level north drift from east crosscut No. 4 advanced 22 feet, continuing in quartz, giving low assays. East crosscut No. 5 from main north drift extended 20 feet; face in quartz.

OCCIDENTAL.—West crosscut from the south drift, 350 level, has reached the south wall, and we have started an upraise at that point to connect with the 300 level. The crosscut from the 400 level has been connected with the winze sunk from the 300 level. Will continue on the ore found at that point.

CON. NEW YORK.—The west crosscut No. 4, 90 feet north of shaft, 650 level, is out 16 feet; face in clay and porphyry. The east crosscut from the north lateral drift, 750 feet north of shaft, 1100 level, is out 42 feet; face in quartz yielding low assays.

POTOSI.—The raise on the 1230 level, 234 feet south of north line, is up 18 feet; top of raise shows porphyry and streaks of quartz. The joint crosscut, 1300 level, on south line, is advanced a total length of 382 feet; face in porphyry and clay.

BEST AND BELCHER.—1000 level—Upraise No. 1 has been carried up 14 feet; total height, 64 feet; face in soft porphyry.

GOULD AND CURRY.—200 level—South drift from east crosscut No. 1 has been extended 16 feet through soft porphyry and bunches of quartz showing some value; total length, 104 feet. West cross-

cut No. 1, from top of upraise No. 1 from 300 level, has been cleaned and repaired a total distance of 36 feet and stopped.

ALPHA.—The south drift from winze, 80 feet north of shaft, 550 level, is out 105 feet; face in quartz yielding low assays. The north drift, same level, is out 89 feet; face in quartz and porphyry.

UTAH.—725 level.—At a point 150 feet south from the winze station, east crosscut No. 3 has been advanced 38 feet, cutting into east country formation. Work in this crosscut has been stopped, and a west crosscut will be started from near the winze station.

Robinson District.

AN EXTENSIVE FIELD.—White Pine News, Dec. 3: There is no other district in Nevada where the mining field is so extensive and the ores so varied in character as here. On the lower belt are immense bodies of gold and copper ores, while on the upper or western belt, large ledges of silver-lead ores abound. Some very rich streaks of both gold and silver have been encountered, but the district as a whole is what we call a low-grade proposition here, for the reason that it does not pay our miners to ship 200 miles by team and again by rail to a market. When the railroad comes this way and life and capital is infused into Robinson district, it will prove to be "the greatest mining center in Eastern Nevada."

Tybo District.

BETTER DAYS.—Eureka Sentinel, Dec. 5: Mr. Jo M. English, the well-known mine operator, arrived here by Tuesday's train on his way to Tybo, where he has extensive and valuable mining interests. In company with Mr. N. Wescott, he left by private conveyance for Tybo on Wednesday. Mr. English owns and controls the property of the Tybo Consolidated Mining Co., known in the early days as the "Two G" mine. We understand that Mr. English has in view the reorganization of this famous property and is once more placing it on an active producing basis. The Tybo Consolidated, or "Two G," yielded nearly four millions of dollars in bullion in its palmy days, and it is yet scarcely more than prospected.

ARIZONA.

CONCENTRATES.—Prescott Courier, Dec. 3: Ike Hester's freight trains passed through town Friday, loaded with 12,000 pounds of concentrates from the Senator mill and mine for Copper basin. William Connor is in town from his camp at Hillside. Mr. C. has been working ore from his Ajax mine by arrastra process, being quite successful. The ore is mostly free-milling gold, and he finds that he can do much better working it in arrastras than by shipping to Colorado. Fred Williams is in from the Senator country, where he says a great deal of assessment work is being done. Says he is taking out blocks of rich ore from his claim. F. Scovel is in town from his mines in Crook canyon. Mr. S. is now running two of his three arrastras, by steam-power, and has recently put up a wheel to utilize water-power for that purpose during the winter. He has been working these mines and grinding the gold out in arrastras for several years, and in consequence is now very well fixed financially, besides at the same time developing his mines.

ORO BELLA.—Prescott Courier, Dec. 4: Richard S. Barnes, president of the Oro Bella Mining Co., who returned to Prescott Thursday last from an inspection of the company's property at Bayard, reports most favorably upon what he saw there. He was impressed with the remarkable progress made by Col. Spear, superintendent. Everything pertaining to the camp is in excellent order. Caved tunnels are being opened and repaired with new timbers, and important changes are being made in the tramway, one of which is a new grade from the Lower Grey Eagle tunnel to connect with the incline to the mill chute. The most promising strike yet made under Col. Spear's superintendency is the 2½-foot vein in tunnel No. 6 (Oro Bella), found by crosscutting at a distance of 200 feet from the mouth. After several assays of the ore body, he found it to be very rich, both in gold and silver, one of the assays giving a value of about \$125 per ton, although the president prefers to adhere to the figure given last week in this paper of \$60, as perhaps being more nearly correct. The vein continues the same after drifting, and it is believed will prove one of the most profitable veins yet uncovered by this company. Tunnels 5 and 4, above, are also being run in good ore bodies, which are being gradually developed. Col. Spear does not wish to start the mill until he has a good supply of ore to work upon, but believes the time is not far distant when there will be plenty in hand to be treated. The company owns four mines—Grey Eagle, Ash Spring, Oro Bella and Oro Bonita. Most of the work has been done on the latter two. In doing assessment work on the Ash Spring, a vein of good ore was struck quite recently.

FROM THE GUNSLIGHT.—Prescott Citizen, Dec. 5: The Gunsight camp has met with a small disaster. The 20 stamps—two of them just put in—had been pounding the rich rock to powder just two days, when an awful crash in the engine room told that something had gone wrong. A portion of the machinery was found broken, though nothing more serious than can be repaired at Los Angeles. The engineer left that night for California and probably are now the 20 stamps are again reducing the rock twice as fast as in the days gone. The improved facilities of the present machinery are expected to bring forth far better results in working the ore than heretofore. Twenty men are working at the Gunsight, all of them in the mine during the shut-down. Only four or five men are required for the mine proper when in running order.

AT GOLD BASIN.—Mohave Miner, Dec. 5: Jno. Birnett, owner of the Mountain of Gold Ore, discovered recently at the lower end of Gold Basin, is making preparations to develop his claim in a systematic manner. His partner, J. McKenize, having lately sold a mine in Creed's Camp, Colorado, for \$20,000, they are now in shape to open up their property without resorting to the slow method of grinding out a working capital with an arrastra.

MUSIC MOUNTAIN.—J. W. Munn of Music Mountain has opened up a body of silver ore which for richness and extent surpasses anything ever found in the district. The new find was encountered while drifting at the depth of 100 feet, and is taken out in masses of nearly solid horn silver. A test run of the first ore taken out yielded at the rate of 790 ounces per ton. Mr. Munn has four men

employed, and expects to ship hereafter in carload lots.

GOLD BUG.—The ore from the Gold Bug mine, Minnesota district, which was worked at the sampler last week, gave a return of \$600 in gold per ton. John Nolan, who has just come up from the mine, informs us that richer ore than ever is being taken out in sinking the shaft. In some places, the ore is a solid mass of gold. Forty tons of Diamond Joe ore were shipped from Hackberry to the Pueblo smelters for treatment last week. The ore is second-class and averages 200 ounces per ton. We are informed that Diamond Joe still continues to improve as work progresses.

BRITISH COLUMBIA.

THREE FEET OF ORE.—Nelson Miner, Dec. 5: The crosscut tunnel on the Dandy has cut what is supposed to be the main ledge. It is full three feet wide, the ore being very free from gangue and of a better grade than that in the bottom of the shaft. The ore on the hanging-wall carries considerable lead, while that on the foot-wall is mainly copper. The foot-wall is well defined. By approximate measurements, the tunnel is at least 100 feet below the bottom of the shaft, that is, by the dip of the vein. Drifts are now being run both ways from the tunnel. When asked his opinion of the strike, Superintendent Ray, who, by the way is not a 'boomer,' replied: "I consider that we have something pretty good."

DAKOTA.

HARNEY PEAK MILL.—Deadwood Pioneer, Dec. 2: The main mill building of the Harney Peak Tin Co. is completed, and the delay is now for the machinery. This will not commence to arrive until the railroad spurs are finished, which will be about Jan. 1, after that it will require about three months to place the machinery in position. Superintendent Childs is confident of the outlook, as evidenced by the recent order given to Fraser & Chalmers for three hoists capable of raising rock 2500 feet.

SOUTHERN HILLS.—Developments in the silver district of the Southern Hills continue to show up heavy veins of high-grade ore. Along Jim's creek a large number of prospectors are at work and indications are good. The Caliboga is still taking out ore from the 100-foot level and drifting on the ledge. The shaft has been sunk 130 feet, but the water came in so fast that it could not be handled without a pump. The ore at this level is more extensive and richer than above.

IDAHO.

EASTERN ALTURAS.—Wood River Times, Dec. 2: The prospects of Eastern Alturas were never better than they are at present. Mr. Harger, superintendent of the Big Copper mines and smelter at Cliff, recently received orders from the headquarters of the company in New York to get everything in readiness to resume operations on an effective scale as soon as men and supplies can be got in in the spring. The Bannack Co. is getting in shape to work on its mines and start up its mill in the spring. The Hub mine, recently sold at sheriff's sale to Winters & Greenough, will either be worked by them on an extensive scale or by the old owners, who, it seems, must infallibly redeem it.

ONTARIO.—Idaho Avalanche, Dec. 5: A specimen of ore brought down from the Ontario mine on Florida mountain, the property owned by Messrs. Herndon, Sullivan and Mattison, has been much admired, and shows that those gentlemen have a show for a big mine. They run in a crosscut 50 feet, cutting the ledge 35 feet deep, and have run on the vein for 70 feet on good ore all the way. For the shallow depth, they have a splendid showing. The ledge is 12 feet wide. They are now starting an adit tunnel, which will run 150 feet deep on the vein. On the Independence claim, which is the north extension of the Ontario, the Idaho tunnel, started a number of years ago, will tap the vein 900 feet deep. They have just finished assessment work on this tunnel, and propose soon to begin driving it to the center of the mountain. Brooks has put on sleds to haul Poorman rock to the mill. They are putting up some new building to handle ore more conveniently at the Poorman. The bonanza chute of ore on the Poorman will soon be the yielder of the camp. Men are busy timbering and preparing ground to stope. The manager says he will shortly be able to show an output which will enhance the fame of the camp.

OPAL MINES.—Moscow Star: S. Frankel of New York, president of the North American Gem Opal Mining Company of this city and one of the heaviest dealers in precious stones in the United States, sailed for Europe Tuesday, having in his possession 5000 karats of opals that were mined three and one-half miles from here, valued at from \$30 to \$50 per karat, which he will dispose of, and will also float \$25,000 worth of the company's stock there. The opals which he has with him are the result of the company's operations since August—good pay for the work, surely. The field where the mine is located has been prospected thoroughly, and it shows up as well as the present prospect. The idea, therefore, is apparently to get the wealthiest capitalists in Europe and the United States interested, and develop the industry on a gigantic scale. It is not at all improbable that Moscow may yet become the opal mining center of the United States—or, possibly, the whole world.

MONTANA.

FROM BOULDER CITY.—Mining Journal, Dec. 2: The outlook for the mining interests of this district never looked more promising than at present. There is being more actual mining done, and with better returns to the miners than ever before. The Boulder Sampling Works at this place have been kept running to their full capacity almost without a break for the past four or five months, handling from five to six cars of ore per week. Of course a great deal of this increased activity is due to the erection of smelting works in our midst, for this means a market at home for all our ores, with a vast saving to mine owners in transportation charges. Our "Aladin's lamp" or "miner's candle," has been bid under a bushel to these many years, but the day has come when mining men and capitalists are beginning to recognize the vast extent and resources of our mines. There is a grand opening at

this point for a man or company with small capital to erect a concentrator. There is at least 50 mines and prospects within a radius of five miles of Boulder that have uncovered and already on the dumps thousands of tons of ore that would pay to concentrate and leave a handsome profit to miners.

ELECTRIC LIGHT IN MINES.—Butte Inter-Mountain, Dec. 5: The Blue Bird Company has the honor of being the first to light up a mine in Montana by electricity. The Anaconda, Lexington, Jay Gould, Drum Lummon and others have had electric lights for years, but only at the stations. The Blue Bird installed a plant some time ago for the purpose of lighting up the stations, and finding it so economical, safe and pleasant, decided to place the lights on every level, in drift, stope and winze where work was being done. The stations were supplied with 50 candle-power lamps, and 16 candle-power lamps were placed in other parts of the mine. Some of the lamps were placed at a distance of 2000 feet from the station. Besides the electric light, a system of electric bells has recently supplanted the time-worn cord. This system is arranged so that when a signal for a cage is given on any level, the signal is rung on every station in the mine. In this way, the station tender can be notified if he is wanted on any level without going to the surface.

THE COMBINATION.—The Combination M. & M. Co. expect to have the improvements and repairs on the mill finished and ready to start in full blast by this date. About a year ago the mine was closed, owing to the drop in silver. There are in all about 24 claims owned by this company. Mr. McClure, one of the principal stockholders in the Granite Mountain, is its president. When work was resumed on the properties, a diamond drill was brought into service, and in a short time a four-foot ledge of ore was struck, assaying from 25 to 50 ounces. It is estimated that enough of ore has been uncovered to keep the mill running for two years. A short time ago, a 12-cent assessment was levied on the stock. This assessment was made to put in the additional stamps, a new boiler and hoist, and for the erection of two new hoisting works upon the two shafts. Those interested say that the future prospects look good for the stockholders of this company.

ADJACENT TO ANACONDA.—Review, Dec. 3: Despite the fact that this has been the dullest season Anaconda has ever experienced, there has been more development work than will lead to great future results in building up our outside interests than ever before. The mineral claims in this district have been prospected thoroughly. New ores have been discovered, and there have been constant shipments from a number of mines this year that were unknown before. Little has been said about the Blue-Eyed Nellie mine, which is our nearest big mine, but work has been steadily prosecuted in it, and we learn that they have now one of the finest ore bodies that has ever been discovered to the mine. We understand that they will soon resume their shipments to Denver. The delivery at Anaconda of ore from the Southern Cross mine has been going on steadily all summer. The shipments are going to Great Falls and Helena. At Silver Lake, there has been renewed activity this fall. The Silver Moss mine there has been bonded to Wm. Hilbert and Mr. Rhodes of Philipsburg, and they are at work on the property taking out ore. It is said that the ore that is now coming from it averages 300 ounces in silver. At Cable, work has been prosecuted all summer sinking on the flat to bedrock and tunneling to be ready early next season to place-mine a large tract. Over on Hanky creek, at the Alps properties, work is going on with unusual activity. The new mill has been started up a week and is pounding away on fine rock. The mill is a broad one of ten stamps. They are running now on ore taken from the Alps, though that of the Goldconda is of a much higher grade. In American Gulch, 20 miles southeast of Anaconda, a number of mines is being worked. At the Royal Gold mine, the mill is running right along on good ore.

NEW MEXICO.

MOGOLLONS.—Southwest Sentinel, Nov. 24: Captain L. W. Burns, a prominent mining man of the Mogollons, was in town last week and reported the outlook for that section very flattering.

AT MALONE.—Thos. Knott & Co. will rebuild their mill at Malone. The mill will be built within a short distance of the spot where Judge McComas was killed by the Indians, in 1883, and on what is known as the McComas mill site. The machinery has all been purchased and construction will be pushed as rapidly as possible. The new mill will be a complete amalgamating and concentrating mill of five stamps.

THE SILVER CORD MINE, a location in the Silver Cell belt, about 1½ miles easterly from that famous mine, is developing in a manner encouraging to its owners and promising to add another producer to the long list of such mines in this county.

JIM CROW.—Two carloads of ore will be shipped from the Jim Crow this week—one assorted, to run \$400 per ton, the other to run \$175 per ton. The ore so far milled from this property, after sorting out the high grade shipping ore, has averaged \$33 per ton. There is a practically unlimited quantity of ore on the Imperial and Jim Crow mines that will average as well. The five tons that were shipped, without sorting, from a recent strike, averaged \$70 per ton.

MOGOLLON.—Cor. Silver City Enterprise, Dec. 4: Capt. Frank Vingo has been shipping high-grade ore from the Little Fannie, during the past month, to the Grant County Mining and Milling Company at Silver City. He finds it pays better to have his ore treated there than to ship to foreign reduction works and pay exorbitant freight and smelting charges. The Last Chance mine is reported in bonanza; the miners in the middle tunnel are working in high-grade ore in the breast of the tunnel at a distance of 250 feet from the mouth, and at a depth of 150 feet from the surface. Superintendent Kimmel went East on Wednesday to meet some of the prominent stockholders; he expects to return inside of two weeks. The regular shipments of gold and silver bullion in the shape of a large brick was made on Wednesday. The bullion sells for \$1.42 per ounce.

PIÑOS ALTOS.—Bell and Stephens started their mill at Pinos Altos, on Tuesday, and let a contract to run a drift 450 feet on the Pacific extension, which will connect the 1000-foot shaft on the south end of the claim with the main shaft, which is 325 feet deep. This will develop an enormous body of ore, which, from all indications, lies be-

tween the two shafts, and throws in sight sufficient ore reserves to run their mill for a long time. In the meantime, while the Pacific is being developed, the mill will be run on ore from the Golden Rule.

OREGON.

DISCOVERY OF COAL.—Fossil Journal, Dec. 3: The town of Fossil, Gilliam county, is greatly excited over the recent discovery of a coal vein within the city limits. Geo. Mettief purchased ten acres of land, situated at the east end of town. He commenced digging a well last Friday, and on the third day struck water at a depth of 18 feet, and at 19 feet farther digging was arrested by what appeared to be solid rock. As coal croppings had been come in contact with all the way down, it was thought that, could the flinty covering be removed, coal would be revealed, and the insertion of a blast proved such to be the case. The first blast threw up coal and slate mixed, but a second attempt brought to light several chunks of absolutely pure coal. The bottom of the well is three feet in diameter, and its surface is completely covered by the ledge. The well is just one mile and a half from the tunnel which was dug into Black Butte Mountain by C. S. Miller several years ago, and is in a direct line on the same ridge.

THE VIRTUE.—Bedrock Democrat, Dec. 4: The famous old mine is to be started up. Mr. A. V. Oliver has arrived at Baker City to resume operations on the mine. He says, "While Mr. Grayson is still interested in the property, the new deal has been brought about by the organization of a strong company, composed of wealthy Oakland, California, capitalists, who have chosen me as their superintendent and manager and their purpose is to operate the mine at once." The first move will be to get a supply of wood for steam power and this Mr. Oliver has arranged for. A few days will be required to overhaul the machinery and hoisting works in the shaft house at the mine and then the work of pumping the water from the mine will be started. The pumping out of the mine will probably take about 60 days. This done and then a force of miners will be put on in the different levels taking out ore, and if the indications are as flattering as now supposed, the company will erect a new large milling plant, the old one being now in decay and entirely useless. The Virtue was discovered in 1863 by the old pioneer prospector miner and frontiersman, W. H. Rockyfellow, at the time engaged in riding the pony express from Fort Walla Walla to Idaho City, or Bannack. The organization of a strong company at this time to work the mine is the advent of a new era and is surrounded with the brightest prospects of success. In the past by actual figures the mine has yielded the enormous sum of \$1,300,000 to its owners, and there is evidence to justify the belief that there are millions yet untouched within the silent walls of this pioneer gold discovery.

UTAH.

THE DRAIN TUNNEL.—Park Record, Nov. 28: Wednesday evening at 7 o'clock a large body of water was tapped in the Ontario drain tunnel, and all work has been abandoned since, waiting for the flood to subside. The flow was so strong that all loose timbers were washed out, the planking between the track was torn out, and the air piping along the side was torn from its moorings, and is now floating in the center of the tunnel. Mr. Keetley informs the Record that about 10,000 gallons of water per minute is now flowing from the mouth of the tunnel, and that nothing can be done in the face until the water subsides. It is supposed to be simply a large pocket of water, and that three or four days will see it spend its present force and subside.

GROWS RICHER AND BETTER.—The Record was reliably informed this week that the vein has been cut on the 1500 level of the Ontario, and that the whole drift was solid ore, as rich as has ever been found in this wonderful mine. From this it would seem that the resources of the property are as yet only partly understood, and that it has a future before it that will astonish the whole civilized world. Before the vein was cut on this level, the mine, according to the testimony of the best and most careful experts in the country, had ten years' active stoping in view, but now the quantity of ore—and it is rich—is so great that the company can figure on at least double the life of the mine and the camp, to say nothing of any new developments that may in future be made. The world at large does not comprehend the immensity of the great Ontario, even when it is admitted to be the greatest silver mine in the universe. Think of the wealth it has added to Utah, to the various industries throughout the country and given to its stockholders. It is a wonderful property, and Park City is proud of it.

ALLIANCE TUNNEL.—Park Record, Dec. 5: Monday night last the entire force in the Alliance tunnel was laid off for the winter, and the big enterprise in which so many thousands of dollars have been spent to locate the ore body is now idle and silent. Mr. Norman, the foreman, informed the Record man that while the lower tunnel would be closed for the winter, active developments would be prosecuted to advantage, as the big tunnel makes a fair drain. There is much good ore in the upper levels of the Alliance, and it will be stope out and sent to market.

ORE AND BULLION.—The Ontario mill shipped 36 bars of bullion this week, containing 22,471.78 fine ounces of silver. For the week just ended there were received at and forwarded from the Mackintosh sampler 498,490 pounds of Ontario ore; Daly, 373,170; Mayflower, 399,170; Anchor concentrates, 375,850; Mayflower concentrates, 25,270; total, 1,110,950 pounds.

LA PLATA.—The Park City men who are interested at La Plata feel very much encouraged over their outlook for big mines in the near future. They are doing considerable solid development work in that camp. Frank Thackwell arrived in the Park from La Plata Thursday night and returned again this morning. The more he sees of that camp, the better he likes it. He reports the weather there about the same as it is in the Park, with about the same quantity of snow. Quite a number of men are now employed in the camp, and it will have a boom next summer sure.

MR. W. T. DEWEY and Miss Aona Wedel of this city were married on the 25th ult. Their many friends extend congratulations.

MECHANICAL PROGRESS.

American and English Workshops.

At a recent meeting of the Manchester Association of English Engineers, Mr. Hans Renold read a paper on "Some Leading American Workshops." Mr. Renold gave his impressions of a few of the leading American workshops which he visited during the recent visit of that association to this country. The paper was quite complimentary to the shops on this side of the Atlantic, and very favorable comparisons made. Among the shops more carefully described were those of Messrs. Brown & Sharpe, Providence, R. I. Mr. Renold, who is evidently an enthusiastic admirer of the American mechanic, laid particular stress upon the manner in which mechanics are treated in this country as compared to the treatment they receive and the estimation in which they are held in England. He took occasion, however, to enforce upon his audience the idea that his opinions, when derogatory to English workmanship compared with that across the Atlantic, were based on an inspection of the best American shops; but even with this proviso, he was greatly struck with the skill, the touch and the understanding of the American workmen.

A reason for this being found in the specialization of the machine trade in America. In the States many firms were found making one thing, and one alone, to an extent of which it was hard for the English mind to conceive. By this means they were enabled to give their exclusive attention to the perfecting of special tools and appliances, by which the cost of production was reduced to a most remarkable degree.

In illustrating this idea, he made special reference to a shop which he visited in Boston, where he saw patent milling cutters being made at the rate of 64 per hour by a dozen men, \$5 spent in wages producing \$150 to \$200 worth of goods.

In the course of his remarks, Mr. Renold paid well deserved compliments to some of our journals devoted to mechanical industries, alluding in a special manner to the practical character of their contents.

As it was evident Mr. Renold had much more to say, an adjournment was voted until the next day to listen to his concluding remarks, and it was furthermore intimated that, as some of his hearers were not in full sympathy with his opinions, they would not be suffered to pass altogether unchallenged.

OLD AND MODERN WAYS OF STEAM HEATING. An article is going the rounds to the effect that the use of steam for heating purposes far antedates the time when James Watt conceived the utilization of it for power. As long ago as the days when Pompeii flourished in its original splendor, steam was used for the purpose of heating buildings, for subsequent excavations have brought to light indisputable evidence of its use. A profitable hint might in some cases be taken from the architects and engineers of those days, who held that the "true and reliable" way to utilize this convenient mode of heating was to build in the partitions of the houses hollow passage-ways, into which the steam was supplied, when by radiation solely the desired heat was transmitted to the apartments to be warmed. With the introduction of pipe it was found more convenient and economical to convey the steam to hollow receptacles, which were set in the different rooms to be heated. The joints in the pipe in those days were made tight by the use of yarn packing, and it is a matter of great surprise to the enlightened American that even to-day this mode of connecting pipes is largely used in England. The Englishman takes slowly to the idea of threading pipes and connecting them by the use of a little red lead. Following along the line of advancement we find that wrought iron pipes are now largely supplanted by cast and ornamental radiators. It is found that greater possibilities of ornamental design are to be had by the use of cast iron, and again cast iron, being homogeneous, gives off heat with greater freedom, representing a superiority over wrought iron as a radiator of from 13 to 25 per cent. Wrought iron conducts heat; cast iron radiates it; wrought iron is a fibrous structure, cast iron a homogeneous one; and so where heat is to be imparted and not stored, cast iron is more desirable to use.—*The American Engineer.*

MANUFACTURE OF STEEL AND INGOT IRON.—Mr. R. S. Casson of Round Oak Iron Works, Brierley Hill, Staffordshire, has devised some improvements in the manufacture of steel and ingot iron, the object being to provide improved means for carburizing the molten metal so that the amount of carbon in the resulting metal may be more or less accurately determined. To this end he introduces the carbon (preferably in the form of charcoal) into the casting ladle, and then taps the metal direct from the converter or furnace into the ladle, after adding any desired quantity of ferro-manganese or other material. In this way a high percentage of carbon can be readily introduced into the metal and a high grade of steel produced. In practice, for producing a high-grade steel capable of standing from 26 to 34 tons tensile strain, Mr. Casson proposes the use of about 5 pounds weight of finely ground charcoal per ton of metal, and also to increase some-

what the normal percentage of ferro-manganese. Other forms of carbon than wood charcoal may be employed so long as they do not contain such a high percentage of sulphur or other ingredients as would be injurious to the resultant steel.—*The Mechanical World, London.*

A NEW USE FOR OLD STEEL RAILS.—We have already alluded to the use which has recently been made of old railroad iron instead of wood for "timbering" mines. But it seems that our English cousins are making a still wider use of this constantly increasing amount of old rails. The Birmingham Trade Circular calls attention to a recent English patent by which old rails are prepared for a more general use, as follows: For steel rail pipe and framework for collieries, mines, shafts, tunnels, aqueducts, bridges, jetties, gantries, culverts, sewers, flues, cattle-creeper, cellaring, supports, etc. The objects of the invention are to utilize old or defective rails, both of which are equally serviceable with new rails, and to provide props and other supports of great strength and security, which, from their material, are practically imperishable, and will also be eventually cheaper than any form of mining supports. Mr. Barnes has made use of iron and steel rails, which are cut into suitable lengths, and by slots or notches at the ends are shaped so that they can be easily framed together. The journal we are quoting from is informed that the Whitehaven Colliery Company is testing several main road sets, and that they have stood unaltered in position under the greatest possible pressure and strain, and the sole struts have effectively prevented the heaving or rising of the floors. The company speaks highly of the systems, and intends extensively adopting them at all its pits.

IMPROVEMENT IN PUDDLED IRON.—Some improvement in the manufacture of puddled iron has been patented by Mr. J. A. Crawford of Church street, Walker-on-Tyne. It is not often nowadays that much attention is paid to introducing anything new in the puddling process, as owing to the advances made by steel, and the extent to which iron has been driven out of the market by it, puddling iron has been looked upon as a dying industry. Mr. Crawford, in manufacturing malleable and gun iron by the hand-puddling process, proposes to melt the pig iron to be used in a cupola with a small amount of scrap, and on the iron becoming liquid, it is conveyed to the puddling furnace, and allowed to remain there until it has reached the standard heat. If scrap is scarce, manganese may be added to the liquid iron after leaving the cupola. It is claimed that the output per puddling furnace is much increased.—*Glasgow Engineer.*

AN EXPERIMENT.—According to the *American Machinist*, one of the great street railway systems of Chicago is to experiment with steam locomotives brought from France. Of course, says the *Machinist*, this road could get all the locomotives required for this purpose in this country, but if those made in France are better for the purpose, then it is a good thing to find it out. There have been already a good many efforts in this country to use steam and compressed-air locomotives, but, generally speaking, these efforts have not been successful. If some one in Paris can furnish us with what is needed for the purpose, we hope he will find ample sale for what he makes, even though Yankee pride gets a shock. No matter what improvements may be discovered in the foreign make of any special machine, Yankee inventors will soon, after giving them a thorough, practical trial, thoroughly Americanize them by still further improvements.

STEEL CARS.—Steel cars are proving a success. Ten of them, the property of the Calumet and Blue Island railroad, of Illinois, have been in freight service for several months past, and have given excellent satisfaction. They are in the coke trade, and enter the Connelleville region over the Pittsburgh and Lake Erie. A representative of the company using them recently eulogized them very highly, and said they were standing the wear and tear well. In many respects he thinks they are superior to all wood cars, as there are no especially weak parts about them. Steel cars must soon come into general use for both freight and passenger service. In the latter use they would be much less destructive to human life and limbs than wooden cars, which generally get in their destructive work by means of splinters, broken timbers and fire. Steel cars will not break up nor take fire.

PLATINUM.—The price of that valuable and scarce metal, platinum, has been on the decline during the past year, and is now about one-half what it was one year ago. The crude product has, however, recently commenced to advance in value, and some anxiety is felt by consumers, who fear that it will again rapidly take an upward course and reach the high figures of one year ago. This metal enters very largely into the construction of incandescent lamps and all good contact points, and its increase in price would be felt quite largely throughout the electrical industry.

THE WORLD'S WORK.—Some one has very truly said that the world's work is not done by corner lot speculators, but by those who, by their individual efforts, create value of some kind, and the feeling is becoming general that their burdens should be lightened somewhat.

SCIENTIFIC PROGRESS.

The Next Advance in Telescope-Making.

Why, asks the *Pall Mall Budget*, is it so difficult and expensive to construct an immense telescope? From the time of Galileo to that of Clark, steady work has been done, and each step has given us a larger object-glass. The pupil of the eye is one-fifth of an inch in diameter, and can grasp but a limited amount of light. A 25-inch object-glass will enable the eye to take in over 15,000 times more light, and with such a glass the moon can be seen as though it were only 80 miles away; but if the size of the object-glass could be further increased, the moon would be brought considerably nearer. To make a large object-glass is the difficulty, and it is only after years of patient work of the most skilled men on earth, and after repeated attempts, that one can be produced which is accurate. Slight differences of specific gravity, changes of structure due to jarring, strains resulting from unequal pressure and changes of temperature, are all capable of ruining the work.

A New Field for Electricity.

Some one who is anxious to anticipate events has asked: Why not replace the glass, which is only a medium transmitting light at a different velocity from air, by a properly constructed electric field? It is conceivable that an electric field 50 feet in diameter could be arranged. Just what the nature of this field should be, with our present knowledge, we cannot say, but some day it will be known, and then the secrets of the other planets will be ours. Ether (says a technical paper) is now paramount with experimentalists; some day it will form the basis of all electrical text-books. We seem to be on the verge of discovering something really great in the world of ether. The early experiments of Faraday, the marvelous mathematical researches of Maxwell, and the crowning experiments of Hertz, all show the intimate relations which exist between electricity and light. They have so entirely changed our views of science that it has been truly said that electricity has annexed the whole domain of optics.

Unconscious Influence.

When so much is said by moralists about exerting a good or bad influence, that which the individual is directly conscious of is usually meant. Yet it can scarcely be doubted that the influence unconsciously emanating from every life is more important than its owner knows, or can begin to understand until the wider vision of the larger future life makes plain much that is doubtful and obscure in this. How little of what we know of the effect of our unconscious influence may be guessed in our ignorance of the causes that have combined in ways we cannot now see to make us what we are. No one who has lived past middle life will refuse to acknowledge that much the greater part of the influences that have determined his course in life were foreordained for him before his birth. Parentage, ancestry, even to the third and fourth generation, affect character so that it may be beyond the influence that can be brought to bear on the individual life.

No one knows or can know the extent to which unconscious influence operates. In this life, slight and seemingly unimportant incidents bear fruit that astounds those who first influenced it. Yet, in the main, the actions of the present life bear their fruit in the greater hereafter. Herein lies the greatest incentive to right living. Whoever has influenced men or women for good, that influence extends through life. It is equally so wherever the influence has been for evil.

Some years before his death, Daniel Webster, the greatest statesman this country has ever produced, was asked what had been the greatest thought of his life. With more than usual solemnity, he replied: "It is that of my personal responsibility for what I do in this life to my Creator." It requires an intellect like that of Webster to think such a thought as this.

To how many men, this thought, appreciated as it should be, must be overwhelming. If their lives have been wholly evil, that evil must go on in other lives through successive generations. But there is a brighter view of human future than this. No life is wholly evil, and the good influences which men exert, unnoticed perhaps at the time, enlarge until the good overcomes the evil. It is, in the long run, the good which survives, and the evil that is overcome and perishes. Only thus could the good finally be triumphant, as the seeds and prophecies in all ages have believed it will be.—*Selected.*

WHY SHIPS ARE NOT STRUCK BY LIGHTNING.—For some time past it has been remarked that ships at sea are far less often damaged by lightning now than was the case when wooden ships were so much in vogue. This has been noticed even under the tropics, where violent storms are very frequent. According to some returns made of the statistics that have been accumulated since 1879 by the German authorities, this must be attributed to the general use that is now made of wire rope for rigging purposes, as well as to the fact that the hulls of ships are usually constructed of iron or steel. Thus the whole ship forms an excellent and continuous conductor, by

means of which the electricity is led away into the ocean before it has time to do any, or serious, damage. Captain Dinklap, who has had charge of the commission appointed to investigate this question, states that no case has been recorded where a ship rigged with wire rigging has sustained any damage from lightning, except in a few instances where continuous connection had not been made with the hull. But wooden ships rigged with ordinary rope rigging still showed the same percentage of casualties as formerly, when they are not fitted with lightning rods, and when the proper precautions are not taken to maintain their efficiency.—*Electrical Review.*

PHOSPHORESCENCE.—M. Henri Becquerel has recently studied the different manifestations of the phosphorescence of materials under the influence of light and heat, and has communicated some observations upon the subject to the Académie des Sciences. The result of M. Becquerel's experiments up to the present time is to place the phenomenon of phosphorescence induced by heat (hitherto considered as distinct from all other phenomena of the kind) once more into the class of known and studied phosphorescence effects. One fact in particular deserves attention in connection with this subject—the conservation to an indefinite time in certain bodies of a portion of the energy which they have absorbed, and which they emit upon being heated. M. Becquerel asks by what mechanism this energy is thus maintained in its potentiality without appreciable loss. He declares himself unable for the present to answer this question but he looks to future research for information upon the subject, which may have the most important bearing upon the state of knowledge of the mechanism of light radiation and the storing of energy in its highest and most intense forms.—*Electrician.*

DIVERGENCE IN NORMAL ATMOSPHERE.—M. Lancaster has recently indicated in *Ciel et Terre* the divergences from normal temperature in Europe in the five years 1886-90. It appears (and is shown in a map) that the centre of the "islands of cold" lies over the north of France, the south of Belgium, and the most western parts of Germany. From this centre the cold decreases pretty regularly outwards on all sides to a nearly circular line of *nil* divergence, which, embracing the whole of Great Britain, crosses the South of Sweden, then goes along the German Russian frontier, through Hungary, the south of Italy, the north of Africa, and across Spain. Throughout this enclosed region abnormally low temperatures have prevailed. Siberia, too, shows thermal depression, which M. Lancaster thinks may be connected with that in Western Europe.—*Nature.*

PROGRESS IN PHOTOGRAPHY.—As an instance of the great progress that has been made in the methods by which rapid movements can be analyzed, the *Photographic News* mentions a series of photographs lately taken by Anschutz of Liège, who has already given to the world some of the best instantaneous pictures ever taken. The subject of the pictures at present under consideration is a dog jumping over a small bush. In the act of making one jump, the animal has been photographed 24 separate times, and each picture is not a mere silhouette, as was the case with Maybridge's first attempts of this kind, but a little picture showing half tone and detail.

ASTRONOMICAL VEHICLES.—Dr. Elkin, the astronomer of Yale University, and formerly of the Cape of Good Hope, has, by a long series of observations on the parallax of the Star Arcturus, arrived at the conclusion that it moves with the inconceivable velocity of 381 miles a second—that is to say, it would traverse the distance from London to Edinburgh between two ticks of a watch. This is 21 times faster than the speed of the earth in its orbit round the sun. Dr. Elkin also finds that Arcturus is so far away from us that his light, traveling 190,000 miles a second, takes 181 years to reach us.

THE AROMA OF WINE.—At a recent meeting of the Paris Academy of Sciences, M. Rommler read a paper on the yeast of wine—the bouquet, or aroma, of the wine made from grapes of the same species but grown in different districts being quite distinct. The characteristic bouquet seems to be due to the district, and wine from elevated vines or outcrops does not necessarily possess the special flavor of the original when planted in other districts. It is well known that the best wines are produced from grapes raised on volcanic soils.

PLOWING WITH DYNAMITE is the novel suggestion by Mr. D. U. Sloan of Atlanta, Ga. His purpose is to break up the soil to a depth of two or three feet, as is done by the expensive trenching method. His plan is to drill 1600 holes to the acre, two to three feet deep, and to put a small amount of explosive in each hole, and fire them by electricity or otherwise. He has tried the experiment and says it will not cost more than \$25 per acre, and thoroughly break and pulverize the ground.

UP FROM THE DEPTHS.—A somewhat singular artesian well in Missouri is throwing up all sorts of things, among which pyrites and quartz of various kinds have been found. There are also numerous specimens of petrified wood, fire opals, shells of various kinds, and other interesting articles.

ELECTRICITY.

Rapid Progress of Electric Railways.

There is nothing in the history of industrial or educational progress, which has illustrated more emphatically or more clearly the value of the "press," as a general educator of the people or a helper in material progress, than the part it has played in the wonderful advance which electricity has made during the last few years. Whatever is new in science or industry, is taken up at once by the intelligent press, and, with the speed of lightning, carried and proclaimed in every portion of the civilized world. A widespread interest is thus set up, which urges on busy brains everywhere, to study, to plan and to invent new methods and new processes for the accomplishment of possibilities pointed out, by which money-getting may be facilitated, pleasure more readily secured or science and industry more rapidly advanced.

Not more than 12 years have elapsed since the first crude suggestions were made in regard to the possibility of running cars and trains by electricity; and only four years ago, according to Prof. F. J. Sprague, in the September *Forum*, the number of electric roads in successful operation could be counted upon one's fingers. At that date of writing, the professor estimated that there were then in successful operation or under contract not less than 350 roads in the United States and Europe, not counting those in Austria or Japan. These roads embrace not less than 2600 miles of track; 7000 cars and 4000 motors. They make a daily mileage of about 500,000 miles and carry fully one thousand million of passengers annually. They give employment to fully 10,000 people, and are credited with a less proportion of accidents than any mode of locomotion known. Over \$50,000,000 are invested in this industry in the United States alone, not including the further enormous sum of investments and employees engaged in the business of constructing electric cars, motors and other appliances, indispensable to this enormous business. Since the article in the *Forum* was written, the progress has been even still more rapid, as will be seen by the address, an extract from which is given below.

Is there any one who would venture the assertion that one-fifth part of this progress could possibly have been realized without the aid of the daily and weekly press in collecting, collating and disseminating the vast amount of information which has been required to bring about these grand results? Books would not have accomplished as much in a lifetime. It is to intelligent, live and progressive journalism that the world is chiefly indebted for the rapid strides—rapid far beyond all precedent—which have been made during the last 40 years, in every department of industry, science and thought.

America Leads the World.

President Watson, in an address delivered at the recent meeting of the American Street Railway Association, said: "It is a source of no little satisfaction to us to know that, in the development of the electric railway, America leads the world. Three years ago, there were only 13 electrical roads in the United States; now there are over 400, and the advances from every part of the country indicate that before the close of the present year the number will be increased to 500. The capital now invested in American electric railways exceeds \$75,000,000. 'Horse sense' counts for but little in this age of rapid transit. We old dogs have been obliged to learn new tricks, and without the usual privilege of serving an apprenticeship. Our stables are being converted into power houses; the electrician has taken the place of the veterinary surgeon; our drivers are being educated as motor men, and most of us have horse-cars for sale."

Our cities and large towns are becoming bunnies for street railways, and chiefly electric railways, as the bulletins of the present census bureau show that in 54 of the largest American cities the mileage was nearly doubled between 1880 and 1889—the exact figures being 1983 miles in '80 and 3150 miles in '89.

In this connection it is interesting to note that the number of horses employed on street railways has fallen off since November 1890, from 116,795 to 83,114—a decrease in one year of 28,681. At this rate it will not take long to entirely emancipate the horse from the slavery of street railway drudgery.

The Practicability of Electric Roads.

The foregoing remarks refer almost exclusively to street railroads; but there is good reason to believe that electricity will soon be economically applied even to our transcontinental roads.

The recent interview of a New York paper with Mr. Edison, in which he was reported to have expressed himself most enthusiastically in regard to the application of electricity to railroads in general, has been received with much incredulity by many of our contemporaries; but Mr. Villard, who has been closely connected with Mr. Edison in his recent experiments in this direction, since his arrival on this coast has fully confirmed the reality of those interviews, substantially as they have already been given in these columns.

Henry Villard is one of the brightest men in the railroad business. His opportunities for thoroughly looking into Mr. Edison's experi-

ments have been as full and free as could possibly be had, and when he says, as he has said, that trains on the Northern Pacific will, before long be operated by electricity, we have good reason to believe that he knows just what he is talking about.

Mr. Villard is president of the Edison Electric Co., and with Carl Schurz and others, represents a vast amount of German capital which has been invested in many of our important electric enterprises, under the name of the North American Company. He asserts that this company is already introducing electricity on some of their roads. The St. Paul and Minneapolis is one of their roads, which is really a belt road 20 miles in length—twice the distance between the two cities as the road runs. This road has only been running a short time, but already we hear that several trains which have been operating between those two cities on steam roads have been taken off owing to lack of patronage and extra cost of operation. People prefer to travel on electric roads. They are cleaner, less noisy and more speedy.

Mr. Villard says: "I have applications for over 20 different inventions for long-distance electric transportation. There is no doubt in my mind that overland trains will ere long be run by electric power. The question will be solved, I think, by having separate motors under each car. The difficulty now is that an electric locomotive is not heavy enough to produce sufficient traction to pull a long train."

This objection is to be obviated by running short trains, or by distributing several motors along the length of the train. This is perfectly practicable and economical. An electric motor will only pull three cars. It lacks weight, hence traction, to pull a long train. A locomotive has to exert 350-horse power to move a long train. It must have weight to do that work, which causes a large amount of wear and tear on the rail and a much heavier and more costly rail to bear up under it.

Mr. Villard further says: "The possibilities of electricity are quite undeveloped yet, and when the motors are distributed along the train, I think that the days of steam engines will be numbered. I believe that Edison's latest electric car invention is on this principle."

Electricity on the rail will save expense in construction of both rail and motor. It will also make an immense saving in coal, for the reason that it does not take more than one-fourth the coal to run a stationary engine that is required to run a locomotive of the same horse power. Stationary engines of course will be employed to generate the electricity for railroads until we are able to obtain it directly from coal. Water power can be used for generating electricity wherever it may be convenient—say for distances of 25 or 30 miles.

THE FRESNO ELECTRIC RAILROAD ENTERPRISE is fast becoming materialized. The road will reach out in every direction to the colonies which are growing up all around that city. The enterprise is one of much importance, and means a great deal for Fresno and the country immediately around it. It means that all parts of the city will have lines connecting with the business portion of the place and outside settlements, and that transit will be safe and rapid. The incorporators of the company are Dr. Lewis Leach, J. B. White, Fulton G. Berry, Marcus Polasky, Morris Messenger and W. F. Candler. The *Expositor* says: Just when the first step will be taken in pushing the new plan forward to completion cannot now be stated, as the plans are not yet fully matured. But it is understood that something will be done before very long, and that the necessary capital is at hand to carry out the enterprise. The sum of \$1,000,000 is the estimated cost of pushing the new system to completion. Of course, such a sum as this would not be necessary, if it were not the purpose to have everything not only up to the latest inventions, but also in the very best manner. All that is known of electric systems will be put in practice here, and what other cities have tried and found good will be taken into this system here. It means much for the future.

SILK WEAVING BY ELECTRICITY.—An interesting trial has been made in Germany with silk weavers looms worked by electricity. Two looms were put in motion, the result being that the working by electricity was more satisfactory than that by means of ordinary engines or gas motors, and the weaving masses, otherwise necessary for the working on a small scale, can be entirely dispensed with. The German papers think the results named show that house industry could easily be made to flourish by the transmission of electric power.

A BRIDGE CHARGED WITH ELECTRICITY.—After a few days travel over it by electric cars, the great iron and steel bridge over the Tennessee river at Chattanooga, built by the county at a cost of \$225,000, was found to be charged with electricity, several persons receiving slight shocks. Recently the trolley wire was cut by the car company, and the danger is thought to be over.

ELECTRICAL SCIENCE.—Prof. Elisba Gray remarks that electrical science has made a greater advance in the last 20 years than in all the 6000 historic years preceding. More is discovered in one day now than in 1000 years formerly.

USEFUL INFORMATION.

A Substitute for Glass.

Various devices have, from time to time, been introduced as substitutes for glass, but the following bids fair to prove more than a mere temporary or flimsy substitute:

A glass manufacturer of Vienna, Austria, claims that he has produced a new substitute for glass. In an account of his invention, he says: "I dissolve from four to eight parts of collodion wool in about 100 parts by weight, of ether, or alcohol, or acetic ether, and with this I intimately combine from two to four per cent of castor-oil or other non-resinous oil, and four to ten per cent of resin or Canada balsam (soft resin). The compound when poured upon a glass plate and subjected to the drying action of a current of air of about 50° Centigrade, solidifies in a comparatively short time into a transparent glass-like sheet or plate, the thickness of which may be regulated as required. The sheet or plate so obtained has substantially the same properties as glass, as it will resist the action of acids and alkalis and of dilute acids, and, like glass, is transparent and has no smell. On the other hand, it has the advantage of being pliable or flexible and infrangible to a great degree, while its inflammability is much less than that of the collodion substitutes. The compound, as will be readily comprehended, is of such a nature that any desired color or shade of color may be imparted to it by the admixture of the necessary pigment. The pigments should be soluble in the solvent used in the preparation of the compound, if incorporated therewith; but the color may be imparted to the substance by surface application, aniline dyes or colors being employed, so that the sheets or plates may be used in lieu of stained glass. The material may also be ornamented by printing any desired design thereon."

BUTTONS constitute a very large as well as useful, not to say indispensable industry. The demand for them is rapidly increasing, especially since the gentler sex is making so large a use of them, larger in fact than that demanded by the other half of mankind. Just now, metallic buttons are in the greatest demand, perhaps, but there are others that are rated as almost equally good sellers. The large duty on pearl buttons has compelled the introduction of this industry into this country, and several quite extensive factories in New York and Philadelphia are now in successful operation; while the one in Chicago has not yet started, it will soon be in a position to turn out goods. The demand for pearl buttons, while not quite as large as formerly, does not appear to largely diminish. For men's clothing the hard rubber button retains its popularity. They come in regulation sizes, no special novelties being often offered. The metal buttons, other than aluminum, are in bronze, copper and gold. They are all imported goods and of the cheaper qualities. The jet buttons are always popular. They are all made in Bohemia. Jet, however, is a misnomer, as they are only a black glass. The price depends upon the cutting of the goods more than on the sizes. The pressed range lowest in price. Where there is only a top cut the price is also comparatively cheap, but the ascent commences as the cut facets increase. Silk buttons, in all shades, to match the tailor made dresses, are just now great sellers. They are home made. The agate buttons have a field of their own from which they never waver. They are used on certain classes of underwear, prints, etc. There is really only one house, and that in France, that makes good agate buttons, which do not break upon the slightest provocation. The German imitations are nearly all more or less faulty in this respect.

INFRINGING ON AN ANCIENT IDEA.—"There is no new thing under the sun." Messrs. Robinson of Long Acre, in the course of their business of supplying artists with pigments, become possessed, from time to time of remains of the great Egyptians, to be in due course ground up by them, and sold in tubes as "mammy" paint. The firm recently lent a piece of the beautifully woven and preserved linen bandages, in which a high priest and keeper of the baths had been preserved, to be shown at some convocation or lecture in the Midlands. The texture and quality excited great admiration among the audience, which culminated in something like astonishment upon the declaration of a manufacturer that this fabric, woven, perhaps, by a contemporary of Moses, contained the same disposition of threads which he had independently invented and patented only a year ago.—*Pall Mall*

AN INTERESTING TABLE COMPANY.—An exchange says: "Around a table in the cafe of the Chicago Club are to be found every day at lunch, Marshall Field, with a fortune of \$40,000,000; George M. Pullman, \$25,000,000; P. D. Armour, \$20,000,000; L. Z. Leiter, \$20,000,000; Potter Palmer, \$10,000,000, and N. K. Fairbanks, \$5,000,000. Field, Leiter and Palmer began life as clerks in dry goods stores, and Pullman as a railroad conductor. Armour and Fairbanks did not start at the bottom of the ladder."

BREAD FROM SAWDUST.—Experiments are in progress, under the auspices of the Agricultural Department, looking to the manufacture of bread from sawdust. The chemical constituents are identical.

SHOP NOTES.

Something About Pulleys.

Much is being said of late about pulleys. It is the object of every proposed improvement to get the most work out of them with the least application of power. The chief source of loss arises from slipping, and various devices have been designed to remedy this evil. Covering iron pulleys with paper is sometimes resorted to, the method consisting in first rendering the pulley absolutely free from grease by means of sal soda, scrubbing the whole surface with a file, wetting with dilute nitric acid for a few minutes to deaden the scratches, then cleaning with water and drying; following this, the paper is applied by winding the strongest gline, or it may be wetted with tannic acid and applied as above. Some prefer to add a tablespoonful of glycerine to a quart of gline and then apply hot. The edges are turned off and a coating of common shellac applied. One of the latest devices consists in the employment of a specially prepared leather covering which is extremely soft and elastic and never glazes by the rubbing action of the belt, as is the case when ordinary leather is employed for the purpose. It is applied to the pulley and held firmly to it for all time by means of a special cement, made so as to be soft and to remain so; unlike ordinary cement or glue, no rivets of any kind being used, as the leather covering is firmly attached to the iron of the pulley by the cement alone. It is claimed that by this device 40 to 50 per cent more power can be transmitted than by ordinarily prepared pulleys, while slipping is reduced to an imperceptible factor. The claim is rather an extravagant one; but if the covering can be kept free from glazing and reasonably elastic it will no doubt prove of considerable value.

Loose Pulleys—Oiling.

An exchange says that there is really no necessity for a loose pulley becoming a nuisance, provided it is properly constructed in the first place and well taken care of afterward. One of the principal faults in construction is imperfect balancing and the manner in which the oil is applied to the shaft. Frequently the loose pulley with a light hub, is provided with no other facilities for oiling except a hole drilled through the hub—perhaps not more than one-fourth of an inch in diameter—with no other provision made for either retaining the oil or excluding the dust. A wooden plug is sometimes inserted, and while this may answer a good purpose for excluding the dust, is necessarily of such a length that when forced in the oil hole the greater portion of the oil that has been applied is forced out, so that only a few drops are left to answer any useful purpose; and while a small space on each side of the oil hole may be lubricated, the ends will often be found dry and cutting. With such pulleys, no matter how careful the operator may be, it will only be a question of a short time when they will begin to rattle and become a general nuisance.

"Let Her Run."

There are some shop bosses who will allow a belt to be put on and allowed to run at will, with very little attention to either pulley or belt. The lubrication of the pulley may be neglected and the belt may also be suffered to become dry. Such persons ignore the fact that pulleys and belts need care and attention as well as any part of the machine itself. They are indifferent to the fact that a belt will become dry and hard by neglect—that accumulated dust and dirt will destroy the life of the best leather, render it hard and smooth and liable to slip and waste power. A wise man will look after all these little things and save money for himself or his employer. He won't simply put a belt on and "let her run" without further care.

THE LONGEST SHAVING.—In the machine shop attached to the armor-plate department of the Homestead Steel Works, where are made the great steel bolts to fasten the plates to the vessels, there occurred the most unusual thing recently. A bolt was being turned on one of the lathes, and the workman operating it turned off a shaving 265 feet long. This is without doubt the longest shaving turned on a lathe in the world, and speaks volumes for the quality of steel made at Homestead. Some years ago, at the Woolwich Arsenal, England, a shaving was turned off a gun measuring 171 feet, and is exhibited there as a great curiosity. The Homestead shaving will be made into a Turk's head and placed in the civil department of the works. It will also be well worthy of a place in the approaching Columbian Exposition.

HAND OR MACHINE RIVETING.—It is generally believed that hand riveting is stronger and more reliable than machine riveting, but recent investigations seem to point the other way, at least we infer such to be the case if we consider the statements and examine carefully the illustrations shown at a lecture recently delivered before the Franklin Institute by Mr. Barnett Le Van.

THE MAMMOTH CORE SAW, built at Tanton, Mass., and intended for boring out barrels from solid logs, to which allusion has already been made in these columns, is already in successful operation in or near Laoroese.

Passing Events.

We publish in this number of the PRESS the address of the miners of Placer county to the citizens of California upon the occasion of calling a State Miners' Convention. It will repay perusal by all who desire the industrial advancement of California. The miners desire to bring the attention of Congress to certain things detrimental to the industry, and for this reason representatives of the different counties will meet in San Francisco January 20th.

Another example of failure of a mining project by putting up works before a mine was found is chronicled in Siskiyou county, where the furnaces erected have not quicksilver ore enough to keep them running. They have had to shut down while ore is hunted for.

Comstock mining and milling systems are under discussion just now, and the facts brought out in the Hale and Norcross suit are not very encouraging to people who invest in mining securities. The directors apparently did not direct to any great extent, and those people in a position to make money handling the ores seem to have had pretty much their own way. Of course no mine could pay under such a system.

The Miners' Address.

The address of the Miners' Association of Placer Co. to the people of California sums up, as briefly as may be, certain grievances which it is desired Congress shall give heed to, with a view of encouraging, instead of as now, discouraging the mining industry. What the nature of these are is set forth in the address. The restricted interpretations of the statutes relating to mining, by the Departments and Courts, have thrown many obstacles in the way of obtaining title to mining claims. Large tracts of land are passing from the mineral domain into holdings of corporations or individuals, a course evidently not intended by Congress, but made possible by the rulings and decisions which have taken the place of the plain law.

As to the hydraulic question, that much discussed subject, the miners want Congress to carry out the recommendations of the Government Engineers, who were appointed specially to report on the matter. They say that dams can be built to restrain the heavier debris, and that the lighter can be cared for by the rivers themselves, when properly improved. Under these recommendations, some of the hydraulic mines would again be worked without injury to other interests; the miners want Congress to order some of these dams built, and order them so that a local court cannot interfere.

The rights of mining exploration, occupation and purchase want to be more exactly determined by Congress than at present, so people cannot obtain mining ground except under the mining laws.

The address is plain in its language and urgent in its tone. That it will call the attention of the public to the mining situation is evident.

Impressions of the Mining Congress.

Mr. Almarin B. Paul made us a call during his stay in the city this week, and from him we gathered some points as to the "Mining Congress" held at Denver, Colo., last month.

Mr. Paul considers the meeting a great success, mainly from the fact that every mining State and Territory was represented, and with but few exceptions, every State in the Union, which showed conclusively how widespread is the interest in mining.

The intellectual status of the body of delegates, numbering nearly 600, he said could not be surpassed by any gathering of an equal number of men. He considers it a great mistake, however, that so little attention was given to other mining subjects of equally vital importance with silver—to wit, railroad land claims and hydraulic mining especially. The silver question alone absorbed all the time until within the last hour of adjournment.

Mr. Paul speaks highly of the enterprise of the citizens of Denver, and Colorado as a prosperous State, and says in comparison, California is asleep. He illustrates it by stating that 80 trains a day leave Denver, and that during his stay there, as high as 1020 carloads of freight came there in a single day and as high as 1250 tons of high-grade gold, silver and lead ores for the smelters in a single day.

Colorado, with a population of about 400,000, produces \$30,000,000 in her metals, while California, with three times the population, produces not over half as much. Mr. Paul is pleased with the idea of a Miners' State Convention, as he thinks a State organization needed, and will accomplish much good.

SUMMER SCHOOL OF CHEMISTRY.—At the suggestion of Prof. Rising, the Board of Regents of the University of California has established a summer school of chemistry, to be held at Berkeley during the long vacation of next year. In favoring the proposition, Regent Stebbins declared that it was a phase of University extension, and would give opportunity to many teachers to receive free instruction in a subject in which they teach. An endorsement of the same general subject was made by the board in granting Instructor Ritter permission to take a number of valuable instruments away from the University for use. He will take his students in biology to the seacoast for original investigation during the summer months.

THE Salton sea, in the Colorado desert, is drying up rapidly.

Comstock Mine Management.

The suit of Mr. W. Fox against the Directors of the Hale and Norcross Mining Co. continues to develop interest for all classes as the testimony elicited unravels and throws out in bold relief the peculiar methods employed in the milling of ore.

Part of Thursday of last week was occupied by Attorney Biggett in reading the deposition of T. R. Hofer, cashier of the Bullion Exchange Bank at Carson. This deposition, which was admitted as evidence, is mainly valuable owing to its tracing several checks that were deposited with the bank. Mr. Hofer, by advice of his counsel, refused to answer many important questions. The point of Mr. Hofer's testimony lies in the fact that the Mint records introduced in evidence last week show a list of unstamped bars deposited by C. H. Peters, the clerk of the Bullion Bank, for parties unknown, and the records of Wells, Fargo & Co.'s agent at Gold Hill, also in evidence, show the receipt of these bars.

The depositions of the two clerks—C. H. Peters and H. P. Brown—of the Bullion Bank, showed that they refused to give any information whatever as to the deposit of bullion in their names, or whether they had any interest in them. "At the time these interrogations were propounded, Peters had over \$1,000,000 to his credit at the Mint," said Mr. Biggett.

In the afternoon, John W. Mackey was called as a mining expert by plaintiff. He said that he was engaged in business of all kinds, principally mining and telegraphy. Owing to Mr. Mackey being regarded as having the most thorough knowledge of milling and milling of any witness yet on the stand, we will give his testimony in full in our next week's issue.

The deposition of C. J. Weider, Wells-Fargo's agent at Gold Hill was next offered but not read, for the reason that from it Mr. Biggett wished to prepare a list showing bullion shipments from Jones to Hofer at Carson; also the bullion shipped by Jones to the Bullion and Exchange Bank, and also the bullion shipped by the Nevada and Mexican mills to the bank.

The deposition of E. F. Pierce of Carson showed a long list of bullion shipped to the Anglo-Californian Bank of this city, by which it was sold and the proceeds returned to the Bullion and Exchange Bank for the benefit of unknown owners.

The court adjourned over to Monday, December 7th.

Monday was a lively day in Judge Hebbard's court. A large amount of testimony was adduced showing the recklessness with which proxies were voted at the annual elections for directors of the company. A large number of mining men listened with eagerness to the proceedings during the day. The following stockholders testified to giving proxies for stock which stood in their names, but which was bought for or owned by customers: A. Dond, J. N. Saydam, S. Reddick, A. W. Foster, A. F. Coffin, J. Gillon and A. W. Starn. James Ralph, clerk of the Bank of California, was called to the stand. He testified that, at the time of the last election of Hale and Norcross, 4270 shares of the stock stood in his name as trustee. He had no interest in the stock. He gave his proxy, at the direction of the cashier of the bank, to some one whom he did not recollect. The owners of the stock he did not know. It was held by the Bank of California as collateral security for loans. Nathan Stein, note teller of Wells, Fargo & Co., testified regarding giving proxies for about 8000 shares.

A strong and determined fight was made over the admission as evidence of the books of the Nevada Mill & Mining Co., which was decided by Judge Hebbard in favor of the plaintiff, with the inquiry to be limited strictly to an examination of those entries relating exclusively to transactions with the Nevada mill, upon whose account the plaintiff charges that Hobart ordered Williams at various times as superintendent of the mill to pay checks to Levy, or on his account, during the period covered by the suit of between \$15,000 and \$20,000, and for the six months alone of 1890 of \$7800. The court also directed that any transaction between the Nevada mill and any of the officers of the Hale and Norcross were legitimate subjects of investigation.

"The charges here," said Judge Hebbard, "are conspiracy, and the examination of the books, in so far as they relate to collusive acts between the owners and officers of the mill and the officers of the mine, is proper to be shown at this time. The authorities, I am convinced, allow this to be done, not I will confine the examination to the proofs of collusive acts charged between the dates named in the complaint.

The defense promptly excepted to the ruling of the court, and Charles T. Bridge, book-keeper for Mr. Hobart, carried the books to the witness-stand.

Then Mr. Biggett offered the five checks mentioned last week drawn by the direction of W. S. Hobart and aggregating \$7800 in favor of H. M. Levy, not to the order of Superintendent Evan Williams, during the first half of 1890, indorsed by the Bullion & Exchange bank to the Anglo-Californian and other banks of this city. One of them, for \$1977, bore also the indorsement of H. M. Levy. All these checks were drawn by "W. S. Hobart, per Charles T. Bridge," and under general direction of the witness for Mr. Hobart to do so.

No effort was made to ascertain why the checks were drawn.

Tuesday was a day of argument over Mr. Biggett's proposition to compel the defendants to produce in court as a witness the superintendent of the mine, R. P. Keating.

Judge Hebbard ruled that the demand of the plaintiff to have Mr. Keating produced, or the alternative that the allegations contained in the affidavit of M. W. Fox be considered as in evidence, could not be granted. The court further held that the attempt to have the deposition of Mr. Keating taken by interrogatories in Nevada should have been shown by the plaintiff.

The deposition of Walter E. Sells, a director in Hale and Norcross from March, 1887, to March, 1888, was read. He did not know who asked him to become a director and did not know how many shares, if any, above the five necessary to make him eligible as a director he owned at the time of the election.

William Pierce, foreman of the Hale and Norcross since 1883, testifies that the ore was weighed on an average 1880 pounds.

M. W. Fox, the plaintiff, was called to the stand and testified that he was a stockholder in the Hale and Norcross Company, and has been continuously since Jan., 1886. He was the owner of 230 shares of stock. He first became a stockholder in the company in 1874, and the extent of his holdings from that time to 1890 depended upon the reports from the mine. He purchased stock both for investment and speculative purposes. Between 1889 and 1891 he owned from 500 to 1000 shares of the stock.

H. W. Tangerman, for 30 years miller and miner at Virginia City, after stating that he was familiar with the Nevada mill and the slimes pond, was asked if he had taken samples from the slimes pond. He replied that he had, and that on Nov. 24th last the material was assayed by D. Mindelef of 318 Pine St.

Evading Mining Laws.

The developments in the suit of M. W. Fox against the directors of the Hale and Norcross Mining Co. show the correctness of the position of the MINING AND SCIENTIFIC PRESS in its long-continued contention for a strict observance by all mining companies incorporated in this State of that part of Section 587, Civil Code, Section 1, Books of Mining Corporations, which reads as follows:

"* * * It shall also be the duty of the superintendent to file with the secretary a weekly statement, under oath, showing the number of men employed under him and for what purpose, and the rate of wages paid to each. He shall attach to such account a full report, under oath, of the work done in said mines, the amount of ore extracted, from what part of the mine taken, the amount sent to the mill for reduction, its assay value, the amount of bullion received, the amount of bullion shipped to the office of the company or elsewhere, and the amount, if any, retained by the superintendent. It shall also be his duty to forward to the office of the company a full report, under oath, of all discoveries of ore or mineral-bearing quartz made in said mine, whether by boring, drifting, alanking or otherwise, together with the assay value thereof. All accounts, reports and correspondence from the superintendent shall be kept in some conspicuous place in the office of said company, and be open to the inspection of all stockholders.

The only company on the Comstock that complies with the above law is the Overman, which gives both the ore sample and battery assays. If the Con. Virginia superintendent would give the ore sample assays of all ore sent to the mill for reduction, as well as the battery assays of that milled there, that company would also be conforming to the law. Other companies ignore or evade the spirit and letter of the law. Such things react to some extent in due time, and continued evasion of the requirements has caused a loss of faith in the Comstock mines, to the detriment of operations on that great lode.

MECHANICS' FAIR.—It has been thought that the Mechanics' Institute would omit its usual fair next year, owing to the overshadowing importance of the Chicago Exposition. However, at a meeting of the members of the Institute, after considerable debate, it was resolved to hold another fair at the Mechanics' Pavilion next year. During the discussion, the chairman said that, although the library was self-supporting, the Institute had to meet the following monthly expenses in addition to the insurance: \$110 for taxes, \$500 for interest, \$200 for repairs to buildings, and \$300 for street assessments. This statement completely overruled the objections of those who were opposed to holding a fair next year.

German Progress in Metallurgy.

In recent numbers of the PRESS, we have quoted from Dr. Wedding's paper before the American Institute of Mining Engineers on the "Progress of German Practice in the Metallurgy of Iron and Steel." Among other things, gas-fired boilers are used at some of their works. Fig. 1 of the accompanying cuts shows this arrangement. The economic gain at Hayingen is as follows: Before the use of regenerator firing, on 15 boilers, of 100 square meters heating surface, there was produced per square meter, per hour, 16 kilos of steam; afterward 20 kilos. At Friedenshutte, the gain is still greater—14 kilos of water per square meter, per hour, being evaporated, as against

Condition of Mining in California.

The Miners' Reasons for Calling a State Convention.

To the People of the State of California: The miners and citizens of Placer county, in calling upon the friends of the mining industry to meet in a State Miners' Convention to discuss their common grievances, and to devise ways for general relief, deem it proper to give to the people of this State, through the medium of this address, some of the many reasons which justify and call for this movement.

In doing this, we represent the industry of this State that within the last 43 years has poured into the channels of trade more than \$1,250,000,000 in gold and more than \$30,000,000 in silver. We represent the industry which can again furnish an equal amount if accorded the same fair and unrestricted freedom and en-

partment decisions and rulings, expose and break up a giant conspiracy, which for 12 years past, silently but surely has been, and is now engaged in alienating to itself the people's heritage in the mineral lands, and the annual gold product will double and treble its present figure.

Our grievance is only one—the unfair, unjust and oppressive construction and misconstruction of laws. But it bears on us from many directions and in many ways. From it many consequences have come, direct and indirect. Unless relief be had, and shortly, a large part of it will be entirely wiped out.

Commencing with 1837, the annual gold product of the State gradually diminished by reason of the working out of the rich shallow placers, which were the concentrations of ages of erosion of portions of the older auriferous placers and still older quartz veins. For the exploitation of the shallow placers, unskilled

less, the opportunities of many of our people for obtaining a living taken away, the best iron market in the State destroyed, and a hundred millions of gold that might to-day be in circulation, giving life to all other industries, still buried in nature's treasury. We have no wish to review all that has been stated pro and con relating to this during the last 12 years, but simply claim now, as then, that the magnitude of the industry, both absolutely and relatively, entitles it to the protection of law and not its oppression; that, as a consequence, conceding the fact that hydraulic mining debris has overflowed and injured farming lands, the first trial of relief is not to stop the mining, but to protect the farms. When this has once been fairly tried, if it fail, then is the time to consider other relief. But it will not fail. On this the testimony of disinterested experts is supported by the unanswerable logic of accomplished facts. Debris dams have been built in France and Italy; many of them have accomplished the purpose for which designed, and have stood the time test for 75 years. Disinterested experts have studied the problem presented by our mining debris, and say that it can be impounded and permanently restrained from injuring the farming lands. That statements herein may not rest on our assertion of them, we present for your consideration extracts from the report of the Commission of United States Army Engineers appointed by Act of Congress under what is known as the Biggs bill. This was initiated from a joint resolution of the California Legislature of 1887, being there unanimously agreed to. This Commission spent the years 1889 and 1890 in preparing its report, which was transmitted and received by Congress February 21, 1891. (Singularly enough, no friend of the mining industry has been able to see a copy of that report, until now, though its enemies long since had it.) We quote from the report.

Page 5 (referring to hydraulic mining), says: It is estimated that over one hundred millions of dollars were invested in this branch of mining previous to the restriction by the courts.

Pages 8 and 9: In 1880 it was estimated that the land in the Sacramento Valley damaged by mining debris from the Feather river, Yuba river and Bear river amounted to 41,045 acres, and the value of said land was \$2,510,835.

No mention is made of damage on the American river lands.

Page 14 and 15:

AMOUNT OF AURIFEROUS GRAVEL WORKABLE.

	Cubic yards.
North Yuba watershed.....	30,000,000
Middle Yuba watershed.....	140,000,000
South Yuba watershed.....	500,000,000
Deer Creek watershed.....	25,000,000
Below the forks of the Yuba.....	40,000,000
Bear river region.....	157,000,000
American above the forks.....	105,000,000
Total amount gravel available.....	1,117,000,000

Hydraulic miners thoroughly acquainted with the gold yield of these gravels, estimate the average gold content to be 30 cents a cubic yard, making an estimated total for these, of the almost inconceivable sum of \$335,000,000.

These figures include but a small portion of the watershed of the Sierra, while the same conditions are true to a greater or less extent throughout the entire gold fields of California extending from Siskiyou to San Diego.

In this report, in connection with estimates of workable auriferous gravels and in reference to proposed storage sites, figures of holding capacity to these sites are given, which show a clear margin over and above the estimates of workable gravels.

These sites for storage dams with estimates of cost are given as follows:

Page 13. Referring to the Yuba river.

One at DeQuette point to cost.....	\$640,000
Page 27—Restriction works on the Lower Yuba....	300,000
Page 73—Dam on Bear river.....	177,369
Page 78—Dam on North Fork of American.....	85,656
Page 81—Dam on Middle Fork of the American....	72,188
Page 82—Dam at Rattlesnake Bar, American river	195,891

Total cost of storage dams.....\$1,451,494

We have invited your attention at some length to hydraulic mining, not that it is the only branch of mining which is feeling the unfair interpretation of our laws, but because it has been crushed by it, and the story it tells is most emphatic. The same interpretation of law which has shut down the hydraulic mines can be used to shut down the drift and even the quartz mines. The language used in the decrees of injunctions of the State and Circuit Courts are so worded as to make possible their application to any other mining using water. Concerning this, the report of the Commission says:

Page 4: It will be observed that the decrees are not against hydraulic mining in name, but against the dumping of debris into the streams, ravines, etc., and it would therefore include all classes of mines, should any action be considered necessary to prevent the detritus from said mines entering the streams.

Page 4: All gold mining in California is hydraulic, being the same in principle—running water separating gold from the matter in which it is imbedded.

In addition to the possible and by no means improbable use of debris litigation, drift and quartz mining are hampered and restricted by forces, the pressure of which is only now beginning to be seriously felt. When in the early days of mining the miners made their local laws, they worked satisfactorily because adjusted to the special local conditions. Congress, recognizing this, made its general laws very simple, authorizing the making of the local laws, only adding a limitation as to the size of individual mining claims, and requiring a certain annual expenditure as a guarantee of good faith in holding the claim; also laws were provided for the patenting of

FIG. 1.—LONGITUDINAL SECTION OF GAS-FIRED BOILER AT FRIEDENSHUTTE, UPPER SILESIA.

8 to 85 kilos before the regenerators were used.

The production of ingot iron in the converter has experienced in Germany twice since 1876 a revolutionary change. In that year it was the admirable example of American works, far surpassing in their results, which led to a transformation of German establishments. It would be superfluous to enumerate all the arrangements adopted from the United States; the continuous premelting in the cupola; the continuous operation of the converter, and, above all, the Holley movable converter-bottom may be mentioned as the three most important. With regard to the movable bottom, Holley's original construction was abandoned, little by little, in favor of the draw-bottom, of which Fig. 2 shows the usual form, and which has the great advantage, that without breaking the blast connections, the wind-box only being removed, the bottom can be drawn out and replaced with a fresh one. With regard to the air-passages, some have used bottoms with grouped tuyere holes, and others the tuyere-bottom of Lillenstein, but neither has shown, in the acid Bessemer process, any marked superiority to the other.

In one of the articles quoted, we illustrated the ladles used to transfer the molten metal. In some cases, it is necessary to pass the ladle from one crane to another. Again, the same crane serves to bring the ladle containing liquid pig from the blast furnace and to receive the ladle containing ingot iron from the converter. The latter ladle is delivered to a second crane, which stands in the center of the casting-pit. Fig. 3 shows the arrangement here employed to prevent disaster occurring through a sudden failure of hydraulic pressure in the cylinder. It will be seen that if the crane *a* should suddenly sink while in the position indicated by the dotted lines, the ladle could not strike the mold *c* because of the leg *d* attached to the lower side of the crane-arm, which would be stopped in its descent immediately by the masonry ring *e*. To lower the converter farther, the foot *d* must be brought round to the recess *i*. This is the position shown by full lines in the figure.

It may be remarked here that there are many other devices for the protection of the workmen in this department, particularly at Neunkirchen, where there is a gutter beneath the floor, which serves in case of a breakdown to direct the flow of molten metal to a pot.

FIG. 2.—DRAW-BOTTOM FOR CONVERTER.

FIG. 3.—SAFETY STOP ON STEEL-CASTING CRANE.

couragement which is so wisely extended to all other industrial pursuits; and we represent the industry that, if it did not create the State, at least created all the conditions that entitled it to become one of our glorious Union, and then furnished the means that enabled that Union to maintain its integrity against the most gigantic struggle for disintegration ever known to the world.

California, with its grand gold product, still leads the combined aggregate gold product of all the other States and Territories by a thousand millions, and leads the aggregated gold, silver and copper product of any one of them by over six hundred millions. Even now, the annual gold product of California, restricted as it is, by unjust abnormal causes, is far in the lead of that of any other State, is a third of the total of all of them, and a ninth of the total gold product of the world. We claim, and propose to show to you, that once release the industry from the dragging friction with a small portion of the agricultural industry, clear away the tangling legal web of unfair Court and De-

labor answered, but for the uneroded portions of the older placers and the auriferous quartz veins, labor alone was powerless, requiring the assistance of capital. Then, too, for these last, the conditions of their existence had to be studied and learned, and new methods and appliances of mining, tested and developed. Necessarily, the gold yield to replace the rapidly diminishing product of the shallow placers came slowly. The most readily accessible of these new sources of gold, the quickstart of development and the swiftest of returns, was found to be in the vast deposits of exposed auriferous gravels, the detritus of an extinct river system. In their exploitation, the great industry of hydraulic mining was developed. By itself, in the latter seventies, it was fast increasing the annual gold product of the State, when the legal fight against its existence was commenced, that has continued uninterruptedly since, and resulted in its practical oppression. As results of this litigation, have come the depopulation of whole communities, the property accumulations of years have been made value-

mineral claims in compliance with defunct conditions. So satisfactory were the general laws that they soon superseded the old local laws in this State. During the last ten years, however, Court and Department decisions and rulings have been placing new and restricted interpretations on the statutes, making more difficult the acquiring of patent, and have finally gone further and practically nullified the act of Congress reserving the mineral lands from other than mineral entry and patent. The plain, obvious conditions of existence of our mineral deposits have been ignored and in their place rules set up which will tend to prevent the exploration for mines in these lands and seal up their treasure indefinitely. The statutory requirements to obtain patent are: 1st. A valid location of mineral ground. 2d. Proof of bona fide expenditure of \$500 for labor and improvement; and 3d. No valid adverse claim.

By virtue of decisions and rulings, the requirement now is that the mineral claim shall be a paying mine. Now it is plainly evident that the expenditure of \$500 will not make a mine pay or even develop that it will pay once in a thousand times. Inasmuch as capital will not risk the large amounts necessary without certainty of title in advance, it follows that very few new mines will be sought for.

The shutting down of the hydraulic mines destroys the value of their vast bodies of auriferous gravels. The restrictive interpretations of the mining laws are discouraging the prospecting for new drift and quartz mines and stopping the development of many already discovered. The practical effect of it all is, that the mineral lands are left open to entry and appropriation in large tracts as agricultural, timber or desert lands till mineral shall be actually mined in paying quantities. This was not the intent of Congress, which aimed to encourage the exploration and development of the mineral lands as such.

We have called on the friends of the mining industry to meet in convention to discuss these obvious wrongs against us. We desire, through this convention, to obtain unity of action in securing remedies. We desire to have it so memorialize Congress as to secure prompt and favorable action on the report of the Commission of Engineers herein referred to. We desire, as a matter of simple justice in part return for the losses of ten years' repression of hydraulic mining, as a part of the general public policy of the nation toward its industries, and as a guarantee, both to farmers and miners alike, of a fair, unrestricted trial of the debris dam, that they shall be constructed by the Government and that Congress shall appropriate the money therefor. We desire, further, to so memorialize Congress as to secure such changes in the mining statutes as shall more exactly define the rights of mining exploration, occupation and purchase, and prevent their acquisition in any other way than under the mining laws of the United States.

In addressing the people of the State, we say that our grievances are in a measure yours; we say that the relation of gold mining to the other industries is such that all the others have a vital interest in its prosperity and extension. Gold is the life-blood of society. It is the measure of all wealth and the medium of all exchanges.

Its abundance is of vital, never ending importance, and that State which has the most per capita is the strongest and most prosperous, for it commands the labor, the products and the wealth of the others. Again, where all other industries compete within themselves and against each other in the struggle to become wealthy and lessen individual rewards as they grow, the gold and silver mining industries stand by themselves as those which in their extension increase individual rewards, not alone of their followers, but of the followers of all other industries. They are the only industries that are not competing producers, but on the contrary are competing consumers for all the others.

Apply these general economic truths to our own local California. Consider the disturbance in our affairs caused by a flow of fifty millions of dollars of gold from New York to Europe last spring. Of that fifty millions, five millions was withdrawn from the monetary circulation of our State, disturbing and unsettling values and making money hard to get. Consider if we had ten millions more coming out of the earth every year to meet just such drains, would not we be more assured in our prosperity as a State, and would not each industry feel the additional impulse that this amount of gold would give?

These then are the conditions and some of the reasons why we call on the friends of the material industry of the State to meet us in this convention, and we commend them to your consideration, confident that in them you will see our interest as yours.

FOR SALE—A GOLD MINE (QUARTZ), WELL DEVELOPED; for particulars, address G. W. MUNROE, Glenora, Calaveras County, Cal.

Assessment Notices.

GRANOVILLE VINEYARD COMPANY.—LOCATION of principal place of business, San Francisco, California. Location of works, Hanford, Tulare County.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of November, 1891, an assessment, No. 4, of \$1.00 per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States gold coin to the Secretary, at the office of the Company, 111 Front Street, San Francisco, California. Any stock upon which this assessment shall be made unpaid on the 15th day of December, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of January, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. MERSEFELDER, Secretary.

Office, 111 Front Street, San Francisco, California.

CALIFORNIA CREAMERY COMPANY.—LOCATION of principal place of business, San Francisco, California. Location of works, Novato, Marin County, California. Notice is hereby given, that at a meeting of the Board of Directors, held on the 2d day of November, 1891, an assessment, No. 1, of Fifty Dollars (\$50) per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin to the Secretary, at the office of the Company, 111 Front Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of December, 1891, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 15th day of January, 1892, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. MERSEFELDER, Secretary.

Office, 111 Front Street, San Francisco, California.

DELINQUENT SALE NOTICE.

GRAY EAGLE MINING COMPANY.—LOCATION of principal place of business, San Francisco, California. Location of works, Placer county, California.

Notice—There is delinquent upon the following described stock, on account of Assessment (No. 26) levied on the 27th day of October, 1891, the several amounts set opposite the names of the respective shareholders, as follows:

RUPTURE AND PILES.

We Positively Cure all kinds of Rupture and Rectal Diseases, no matter of how long standing, in from 30 to 60 days, without the use of KNIFE, DRAWING BLOOD, or DETENTION FROM BUSINESS. Terms: No Cure, no Pay; and no Pay until Cured. If afflicted, come and see us or send stamp for pamphlet. Address:

DRS. PORTERFIELD & LOSEY,

888 Market Street - San Francisco.

Assaying.

A second edition of Parts II and III of "Assaying," by C. H. Aaron, has just been issued by Dewey & Co., 220 Market St., S. F. In this edition all superfluous matter, such as a preface, is omitted. A portion of the text of the first edition, which properly belonged to Part I, appears in the 2d edition of that part, or the first volume. This edition contains the same number of pages as the first, namely, 161; but, in consequence of the above mentioned changes, a great part of the matter is new, comprising a description of Volhart's humid assay of silver bullion, additional methods for the assay of sulphur, arsenic, antimony, chromium, etc., a new and accurate gravimetric method for copper never before published in any book, and a new and rapid method for zinc, in which the troublesome zinc sulphide is avoided and only stable reagents are used, and which also has never before appeared in a book.

The chapter on "Manipulation" is extended, and to the note at the end of the volume are added some valuable suggestions as to volumetric assaying in general, and the method by iodine and sodium thiosulphate in particular. In fact, it seems a pity that the last named system has not been described in detail, though the author appears to have refrained from doing so, because it would have carried him beyond his proposed limit, or perhaps in accordance with his usual practice of teaching only that with which he is practically familiar.

The book is not arranged in a manner to adapt it for use as a text-book, and the author disclaims any such intention. As a working hand-book, in conjunction with Part I, treating of the assaying of gold and silver ores, and especially for the use of that large class of assayers who have but little knowledge of chemistry, and have not command of an extensive laboratory, it has no superior, perhaps no equal in the market.

As stated, Part I of these books treats of gold and silver ores in a separate volume. Parts II and III are printed in one volume, of which the work under review is a new edition. Part II is on gold and silver bullion. Part III treats of lead, copper, tin, mercury, zinc, nickel and cobalt, chromium, bismuth, arsenic, antimony, sulphur and salt. This volume (Parts II and III) is sold for \$1.75, post paid.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DEC. 1, 1891.

- 464,261.—INSTRUMENT FOR TAKING NAUTICAL OBSERVATIONS—W. H. Bebler, U. S. Navy.

The following brief list by telegraph, for Dec. 8, will appear more complete on receipt of mail advices: California—Lorenzo D. Clark, Fort Jones, automatic trickler for hand presses; Luth. Cunningham, Saratoga, prune sacking and rinsing machine; A. J. Edmondson, San Buenaventura, railway rail joint; Isaac Kuhn, San Diego, overalls; J. E. M. Prentice, San Francisco, typewriting machine; Moses H. Robinson, San Diego, apparatus for discharging water; Louis Stuber, San Francisco, automatic vent for casks; Maldeimar Terp, San Francisco, apparatus for heating and ventilating rooms; Wm. H. Towns, San Jose, dressing for carriage to ey. Frank Walker, Los Angeles, disintegrating furnace; G. H. Melendy, San Francisco, plane attachment.
Nors.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

MISS ALICE RIDGOUT of San Francisco has been awarded the first prize in the contest of women sculptors for the designs for statuary to ornament the woman's building at the World's Fair.

G. NATHAN, a recent faithful employe of this office, whom we trust and hope will do well, has established a candy store and manufactory at No. 1245 Broadway, near 15th St., Oakland.

Academy of Sciences.

On Monday evening President D. S. Jordan, of the Leland Stanford Jr. University, delivered a lecture on "The Trout of California." Among those in the audience were many anglers who were anxious to hear Prof. Jordan speak on the subject announced. He showed very conclusively that there was no such thing as a "salmon-trout"—a much mooted question—pointing out how the fish of each species could be distinguished. By counting the spikes in the anal fin it will be seen that there is a marked difference in the number of those in a salmon or a trout. The species of trout may be distinguished by counting the scales on the lateral line. In fact, the detection of species is more of a mathematical calculation than anything else. We shall endeavor, on another occasion, to give this lecture in full, when it has been revised by its author.

The museum of the Academy is now open to the public for the first time in the new building.

The main hall of the museum has been put in excellent order. No new specimens have been added to the collection, but the old ones have been carefully rearranged. On each side of the large door leading into the hall is a suit of Japanese armor. To the right of the door are ten clay models of the cliff-dwellers' houses from ruins in New Mexico and Arizona. Next comes a long wall case containing over 50 skeletons of various animals. A human skeleton stands in a case by itself in the right-hand front corner of the immense room.

Arranged clear around the hall are 32 new oaken table cases, containing minerals and ornate cases. Scattered here and there are plaster models of various portions of extinct animals. Against each pillar is a bust of some great scientist, such as Buffon and Cuvier.

In the center of the hall stands the great model of the mammoth, copied from that found in Siberia and now in the museum in St. Petersburg. This gigantic beast is upon a raised platform, about which are clustered a great variety of objects of interest. On the left-hand corner, near the entrance door, is a stuffed orang-utang. Back of this is a singular sponge-like formation known as "Neptune's cup." Next come the immense head and trunk of the Elephas Genesee. Still farther along, that is, toward the end of the large platform upon which stands the mammoth, is the skeleton of the Elephas India, a fossil elephant. Back of the mammoth is an enormous mammoth's trunk from Alaska beside a tremendous tortoise shell. There are other large specimens and many hundred small ones. The collection is growing and is, already, by far the best on this coast.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

MINERAL LANDS AND PATENTS.—The Commissioner of the General Land Office has decided the case of Richard Barden and others against the Northern Pacific railroad. The land in controversy was returned as agricultural, but subsequent to the filing of the railway's definite location, it was discovered to be mineral. The Commissioner holds that the discovery of the mineral character of the land before patent issues, excepts the land from the grant. A similar case is now pending in the United States Supreme Court of Appeals from the Circuit Court of Montana.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE \$1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testlog and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Course Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—JUST OUT.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhart's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc. The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, \$1.75. Sold by DEWEY & CO., Publishers, No. 220 Market St., San Francisco.

NEW AND VALUABLE BOOKS

— FOR —

METAL WORKERS.

LANGBEIN.—A Complete Treatise on the Electro-Deposition of Metals. Comprising Electro-Plating and Galvanoplastic Operations, the Deposition of Metals by the Contact and Immersion Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Descriptions of the Electro Elements, Dynamo-Electric Machines, Thermopiles, and of the Materials and Processes used in every Department of the Art. Translated from the German of Dr. George Langbein, with additions by William T. Brant, editor of the "Techno-Chemical Receipt Book." Illustrated by 125 engravings. In one volume, 8vo, 404 pages. Price.....\$4.00

BLINN.—A Practical Workshop Companion for Tin, Sheet-Iron and Copper-Plate Workers. Containing rules for describing various kinds of Patterns used by Tin, Sheet-Iron and Copper-Plate Workers. Practical Geometry; Measurement of Surfaces and Solids; Tables of the Weights and Strengths of Metals and other Materials; Tables of Areas and Circumferences of Circles; Composition of Metallic Alloys and Solders, with numerous valuable Receipts and Manipulations for every-day use in the workshop. By Leroy J. Blinn. A new, revised, and enlarged edition, printed from new type, and with 170 newly engraved illustrations. In one volume, 12mo, 236 pages. Price.....\$2.50

BRANT.—The Metal Worker's Handy Book of Receipts and Processes.—Being a Collection of Chemical Formulas and Practical Manipulations for the Working of all the Metals and Alloys, including the Decoration and Beautifying of articles manufactured therefrom, as well as their preservation. Edited from various sources by William T. Brant, editor of "The Techno-Chemical Receipt Book." Illustrated by 63 engravings. Over 500 pages, 12mo, cloth, gilt, closely printed, containing a vast amount of valuable matter on all the Metals and Alloys, not to be found in any other book in the English language. Price.....\$3.50

BRANT.—The Metallic Alloys. A Practical Guide for the Manufacture of all kinds of Alloys, Amalgams, and Solders used by Metal Workers, together with their Chemical and Physical Properties, and their application in the Arts and Industries; with an Appendix on the Coloring of Alloys. Translated and edited, chiefly from the German of A. Krupp and Andreas Wildberger, with extensive additions, by William T. Brant, one of the editors of "The Techno-Chemical Receipt Book," etc. Illustrated by 16 engravings. 12mo, 428 pages. Price.....\$3.00

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Dec. 10, 1891.

Rains in the valleys and snow deposits on the mountain ranges, cause a more cheerful feeling in business circles by inspiring the belief that with this year's crop so well marketed, and with the weather outlook favorable for farming and mining, that 1892 promises to be quite prosperous, notwithstanding its being the presidential election year. Iron-workers continue to report active business. The larger companies have bought raw material quite heavily in anticipation of higher prices later on. The local money market is fairly active but easy. Banks report more funds in hand than usually obtained in this month.

The election of Crisp, of Georgia, Speaker of the House of Representatives, is accepted as favorable to the silver interest.

The Eastern money market is reported as follows by the *Iron Age*: "Money continues extremely easy. Even in Boston there is a plethora of funds. Foreign trade is in good condition. In spite of the heavy specie exports in October, the United States exported in merchandise and produce during that month an excess of over \$35,000,000, compared with the imports, the aggregate exports on account of commodities being \$102,900,000. For ten months there is a balance of trade amounting to \$901,000,000, against \$15,000,000 for the same period last year. Further imports of gold bring up the total since Sept. 12th, when the return movement commenced, to nearly \$25,500,000, with \$1,500,000 on the way."

MEXICAN DOLLARS—The market hangs around 75 cts. The demand is only fair.

QUICKSILVER—The market continues firm at combination prices. Receipts the past week aggregate 367 flasks.

SILVER—The market has held to stronger prices throughout the past week, due to depleted supplies abroad and in this country, and to a more favorable attitude of monometallic foreign countries toward bimetalism. The defeat of Mills for speakership of the House of Representatives, it is claimed, was largely due to his speeches on silver in the Ohio campaign. It is the very general belief that a free-coinage bill will be passed by Congress which will be vetoed by the President. If this proves to be the case, then silver will come forward in the Presidential election as an important issue. Bimetallists, without reference to party, will unquestionably vote for the candidate favorable to their views. New York telegrams received to-day report silver at 95 cts.

BORAX—The market is steady at combination prices. The shipments by sea the past week aggregate to New York \$11,427 pounds via Panama and 201,506 pounds via Cape Horn.

LIME—Receipts the past week aggregate 7886 bbls. The market is steady, with a continued good demand reported.

ANTIMONY—The market is firm but quiet.

LEAD—The market is quiet but fairly steady. Eastern advices report a dead and inactive market, with both holders and buyers showing considerable indifference.

IRON—The market for spot, to arrive and for shipment is strong, with an advance asked. The offerings from first hands for spot and to arrive are light. English advices report a dull but fairly firm market. Eastern advices report a stronger undertone due to prospective large requirements in 1892 by the railroads of the country. At Philadelphia, the market is reported as follows: There is more inquiry, perhaps, and more disposition to do business at inside figures, but for the present it is out of the question to think of an advance. The immense output imparts a sense of security to consumers that is hard to disturb, and so long as indications of a full supply continue, it will be difficult to make buyers believe that prices are likely to be higher. That, however, no one expects, the near approach of the holidays, with the consequent temporary suspension of work, being an insurmountable barrier to any immediate movement of that kind.

COPPER—Exports the past week aggregate 665,142 lbs. matte to New York via Cape Horn. The market is about as heretofore reported. The New York market is reported as follows: "Consumers are taking supplies only as imperative wants necessitate, and while outward appearances suggest that the leading producers are indifferent, the fact remains that there is an abundance of copper to sell and that buyers have a voice in fixing the price. Spot parcels of Lake Superior ingot are valued at 17 1/2 cts. Bids of 17 cts have been refused within a few days. It is understood that 17 cts has been offered for fair-sized quantities, deliverable during the first half of next year." London cables to the *Iron Age* of Dec. 3 are as follows: It is stated that copper formerly held by outsiders is now in the hands of dealers. Consumers are buying more freely, present prices being attractive. The properties of the Societe des Metaux reported sold to Credit Industriel at small advance on upset price.

TIN—The market is dull, with no special features to report. Eastern mail advices report a dull and heavy market for both pig and plate. London cables report pig dull and easy, and plate as follows: There is more inquiry from America, but not much business has resulted thus far. Owing to lowness of prices offered, many makers have decided to close their works for one month, from the middle of December, but there is no general movement in that direction. Several large makers are opposed to combined action to reduce the output, considering this course not warranted.

COAL—Imports the past week aggregate as follows: Comox, 4490 tons; Departure Bay, 5590; Newcastle, N. S. W., 2107; Coos Bay, 750; Nainaimo, 4290; Seattle, 2700; total, 19,801 tons. The market shows, apparently, a steadier tone. Cold weather is inducing larger consumption, which naturally causes dealers to stock up more freely. The tonnage on the way from Australia is about 30 per cent less than it was four weeks ago, while the high asking rates for charters at Newcastle, N. S. W., precludes shipments of coal except at an advance.

GEORGE CULLEN PEARSON, manager of the Damata mines, the first in this State to establish a complete electric power plant, left for England this week, to be gone a few months.

Mining Share Market.

Under the proxy system, the rings have been able to keep their dummy directors in office from year in to year out.

Mining shares the past week were decidedly mixed, showing that a master general is in command of the manipulation. The North End shares shined off from 10 to 15 per cent, the Middle shares hung around with a firm tone for Chollar, Hale & Norcross and Savage. The Gold Hill shares went off from 10 to 20 per cent—Crown Point and Challenge suffering the most. Several of the shrewdest operators short the market as soon as they know D. O. Mills is coming to the coast, and remain short until just before or soon after he leaves to return to the East. They claim that Mr. Mills is "deadly" opposed to an advance in the market, for they say he thinks that more money is to be made by those on the inside in another and far more easy way. This report, which is quite general in certain stock circles, we give for what it is worth, yet it is a singular coincidence that the Gold Hill shares, the mines in which he is supposed to be largely interested, appear to suffer heavily on his visits to this coast.

In outside mining shares the Bodies show considerable life, at slight fluctuations. In the shares of Peer and Peerless in the Qujotua district trading was fair at steady prices. The mill is to start up next week on the ore now on the dumps. Several of the Tuscarora mines continue to ship high-grade ore for reduction.

The pools continue to use the suit against the Hale and Norcross directors and the owners of the Nevada Mill and Mining Co., for all it is worth to get outsiders to sell stocks. There is everything to warrant the assertion that seldom, if ever before, the trading public was in such a demoralized condition as at present. While the large majority has sold out, yet there are many who hold only to sell when the market turns so as to let them out even. If past experience is worth anything this is a good time to buy, for with the public selling, the pools must be concentrating, and sooner or later a deal will be made to unload at a good round profit.

Con. Virginia sold the past week at \$3.65 per share, which is nearly as low as insiders said four months ago that it had to go down to; and yet there are gudeguons who say that the pools do not work by any fixed rules, outside of virtually robbing those of the public who have the temerity to deal in stocks.

Several stockbrokers testified in the Hale and Norcross suit that they gave their proxies for stock which stood in their names, but not owned by them, to be voted at the last election of that company. Lawyers who have given the question close study think that in so doing they can be co-defendants in any suit for fraud, misappropriation of funds, etc., instituted against the directors of the company.

The mill rings are fearful that the San Francisco Stock and Bond Exchange may take action looking to preventing brokers from giving proxies for shares not their own, to be voted at a mining company's election. Thugs and their tools say that if proxies are not given them, it is likely that no change in directors or management can be looked for. Seeing that under the proxy system there have been no changes, it looks as if any change in the system would not be any worse, while it might be for the better. Let those who want to control the mines go into the market and buy up the stock, and in so doing more lively times will certainly follow. The proxy system has been the death-knell to the stock business by putting those in office who do not look after shareholders' interests, if we are to accept the developments in the Hale and Norcross suit as typical of what is done on the Comstock.

News from the Comstock mines is still kept back by the pools or rings. It is known that in several of the North End mines, several levels are being opened up for better developing work, and also for ore extracting. Important results can be looked for at an early day. In the Middle mines, the work continues to be very important. Various levels are being opened up for easy extraction of the rich ore found to the west. The officials are still reticent regarding the ore found on the Ward shaft level. In 1890, it was officially announced that the 850-foot Ward shaft level was connected with the Bullion-Potosi works, which would admit of important work. Since then no mention has been made of it. What has become of the west ledge found in both Exchequer and Alpha and which it is said has been run for on several levels. Official letters from Con. Imperial report that ore is being taken out and saved for milling, but the letters fail to report what was accomplished by the work on the 750 foot and 1100 foot levels. Private advices report that in last month four feet of rich ore was struck to the west in Challenge. It is singular that Yellow Jacket does not develop the 1100, 1200 and 1300 foot levels. Mysterious hints are being put out about important work and ore finds in two of the South End mines. The Overman Co. continues to conform to the law by giving both car-sample and battery assays. Why is it that the other companies do not do the same?

Brokers who are not purchasable should see that their Exchange is purged of the odium brought on it through the proxy system.

From the outside mines the news continues to grow in interest, as it always does when the rings have the stocks and are about prepared for a deal so as to unload.

Things on the Comstock are somewhat changed. The time was when the hounds hunted the Fox, but now it is the Fox that hunts the hounds.

The mining share market opened higher this (Thursday) morning, with still better prices at the 2:30 o'clock board. The points are out for slightly better prices to-morrow (Friday), when they should go off to figures lower than they sold at any time this week, after which we will have a good substantial up-move. No one believes that there will be any change in the Savage management, owing to the ring wishing the present officers to be kept in as a scare-crow to frighten outsiders from buying the stock.

PROF. JOHN SLATE has been elected to the Professorship of Physics in the University of California, the place made vacant by the death of Prof. John Le Conte. He has been in the service of the University for ten years, most of that time in charge of the department of

MINING SHAREHOLDERS' DIRECTORY.

Eastern Metal Markets.

By Telegraph.

NEW YORK, December 9.—The following are the closing prices the past week:

Silver in Silver.		London.		New York.		Copper.		Lead.		Tin.	
Thursday.	44 1/2	95 1/2	11 10	4 25	19 90	—	—	—	—	—	—
Friday.	44 1/2	94 1/2	11 10	4 25	19 90	—	—	—	—	—	—
Saturday.	44 1/2	94 1/2	11 10	4 25	19 90	—	—	—	—	—	—
Sunday.	44 1/2	94 1/2	11 10	4 25	19 90	—	—	—	—	—	—
Tuesday.	44 1/2	94 1/2	11 10	4 25	19 90	—	—	—	—	—	—
Wednesday.	44 1/2	94 1/2	10 75	4 25	19 90	—	—	—	—	—	—

Borax is steady at combination prices. Tin continues to fluctuate. Iron has a firmer tone. Lead is barely steady, as is copper. Quicksilver is strong both here and in Europe.

Splendid Holiday Art Gifts.

L. Prang & Co. of Boston, who have led these many years in their American art publications, have this year a more than usual attractive variety of really superior designs and finely executed pictorial prints, as shown by specimens sent us by J. H. Doherty, S. F., agent, No. 527 Commercial St. All first-class stores will no doubt be well supplied with Prang's latest and superior productions, in which Americans can all feel a special pride.

The highly artistic and elegant character of the designs fully sustain, if they do not surpass the reputation of this house in this direction in past seasons. The line is distinctively American, not only as to the original designs, which were executed by foremost American artists, and lithographed and printed in their Fine Art Establishment in Boston, but also as to the style and character of the art hooks, hand-painted and hand-decorated mounts, shape novelties, calendars, etc., all of which were designed and made under their personal supervision.

Our Agents,

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Frue or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

THE PELTON WATER WHEEL CO.

121-123 MAIN STREET, SAN FRANCISCO, CAL., U. S. A.
143 LIBERTY STREET, NEW YORK, U. S. A.

PELTON WATER MOTORS, Varying from the fraction of 1 up to 40 and 50-horse power, unequaled for all light-running machinery. Warranted to develop a given amount of power with one-half the water required by any other. SEND FOR MOTOR CIRCULAR. Address as above.

THE GATES ORE AND ROCK BREAKER.

UNLIMITED IN CAPACITY UNEQUALED IN EFFICIENCY. UPWARD OF 3,000 NOW IN USE. Will do more than twice the work of any other with the same cost in wear. Give a fineness of product that increases the capacity of any mill from 25 to 40 per cent without any additional expense. THE BEST AND ONLY CRUSHER ADAPTED TO MACADAM ROAD WORK. Send for Circular.

It having come to the notice of the undersigned that their patent rights are being infringed upon, intending purchasers are hereby warned that all such infringements will be duly prosecuted. (Signed) THE PELTON WATER WHEEL CO.

IMPORTANT TO GOLD MINERS! SILVER-PLATED AMALGAM PLATES for SAVING GOLD In Quartz, Gravel and Placer Mining.

PRICES GREATLY REDUCED ONLY REFINED SILVER AND BEST COPPER USED. OVER 3000 ORDERS FILLED. FIFTEEN MEDALS AWARDED. Old Mining Plates can be Replated. Old Plates Bought, or Gold Separated. These Plates can also be purchased of JOHN TAYLOR & CO., Corner First and Mission Streets, San Francisco.

SAN FRANCISCO GOLD, SILVER AND NICKEL PLATING WORKS,

E. G. DENNISTON, Proprietor.

653 & 655 MISSION ST., SAN FRANCISCO, CAL.

Our Plates have been used for 20 years. They have proved the best. We adhere strictly to contract in weight of Silver and Copper. SEND FOR CIRCULAR.

RECEIVED EVERY MEDAL Awarded on the Pacific Coast for Silver-Plated Amalgam Plates and Best Gold, Silver and Nickel Plating.

Adamantine Shoes and Dies

—AND— CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

THESE CASTINGS ARE EXTENSIVELY USED IN ALL THE MINING STATES and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to above conditions. When ordering send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.
H. D. MORRIS, Agent, 220 Fremont St., San Francisco.
Special attention given to the purchase of Mine and Mill Supplies.

SQUARE FLAX PACKING.
MANUFACTURED FROM STRICTLY FIRST-CLASS FLAX AND PURE LUBRICANTS. HAS NO SUPERIOR for all Hydraulic Work.
CALICO WATER WORKS CO., CALICO, CAL., Dec. 16, 1890.
W. T. Y. SCHENCK—Dear Sir: We find your "Red-Cord" Square Flax Packing the "Boss." Yours truly,
J. R. LANE, Secretary.
The red cord runs the entire length. Put up in boxes of 20 feet, or coils of 60 to 80 lbs. For sale by all dealers. W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880
September 18, 1883; July 24, 1888;
and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.
Price of Improved Belt Frue Vanner, \$825, f. o. b.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs," for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - - - \$550 f. o. b.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1885.
Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.:

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

Signed) Supt North Star and Original Empire Mining Co
DAVID MCKAY, JR.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS.

Was Awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891.

More than Double the Capacity
With One-Half Less Power and Occupying Less than
One-Half the Space of any other Concentrator.

Built of Best Steel and Wrought Iron.
STRONG AND DURABLE.
Price.....\$575 f. o. b.
Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. This excess in length of material effectually prevents the edges from cracking. Plain edge belts have to stretch about one inch to the foot as they pass around the drums. This continuous stretch cracks the edges. The improved belt obviates that difficulty.

MINING MACHINERY FOR CONCENTRATION,

92 CHRONICLE BUILDING.....SAN FRANCISCO.

We have opened our branch here with our specialties in CONCENTRATING MACHINERY and Appliances, and are prepared to investigate any proposition in the CONCENTRATION OF ORES.

Our work in COLORADO, MONTANA and IDAHO is successful, and we present mining men a proposition free from any experimental nature.

In many ways CONCENTRATING APPLIANCES IN COLORADO AND MONTANA are more successful than those at present employed on this Coast, and we think we can present a CONCENTRATOR which does not compete with any other, and that has received a cordial welcome from mining men.

Coal-Preparing Machinery.

When anthracite coal first comes from the mine, it is not marketable. The "run of the mine" cannot, as in the case of bituminous coal, be sold. With anthracite, it is deemed important to have the lumps as nearly of uniform size as possible, so that between them a large amount of surface will remain exposed to the action of the air without checking the draught too much, or allowing enough air to pass to cool the coal below the ignition point. In other words, if the pieces of coal of the size of a chestnut and smaller are mixed with lumps of the size of an egg, they fill the air passages and prevent a free draught. It has long been recognized, therefore, that one of the most important points in the preparation is to have a uniform sizing, and also to make as large a number of sizes as can be produced without too great expense. It is also essential to remove all dust, which depreciates the value of the coal on the market.

Mixed with the pure coal, large amounts of slate, "slate coal" and "bony coal," generally occur. The problem is to remove these impurities as completely as possible. In recent numbers of the PRESS, within the past few months, we have described many of the mechanical appliances for removing slate, and preparing the coal, the illustrations having been taken from a paper read before the Institute of Mining Engineers, by Eckley B. Cox of Drifton, Pa.

The "Iron Breaker" at Drifton is a structure where the preparation of the coal for the market is carried on. Two veins are here given from photographs of the breaker.

Plate XXXVIII was taken from a point southwest of the breaker and representing the breaker when finished. It shows the harney and gunboat on the plane; and on the left-hand

FIG. 1.—COMPLETED IRON BREAKER, FROM THE SOUTHWEST, SHOWING PLANE AND JIG-HOUSE.

side of the breaker, the jig-house, which projects from the main line of the building, is very distinctly shown. The truss bridge running from the ground to the top pockets (about 26 feet from the ground) is the main entrance to the breaker for the workmen. The advantage of this plane is that it brings the men to the

ground beyond the cars and machinery, thus diminishing the risk of accidents. Plate 2 is a view taken from a point southeast of the breaker. This was taken when the breaker was only partially completed. It shows on the right hand the lump and steamboat chutes very distinctly, and the plane in its unfinished

condition, with the girders carrying the sills. The large wooden structure to the right is the settling tank for settling the slimes coming from the breaker. The water, after depositing in them the most of the fine coal and slimes, is carried off in pipes. It will be noticed in both these plates, particularly in plate 2, that in consequence of the great number of windows all around the breaker, one can see through it distinctly. The thoroughness with which the interior is lighted will therefore be evident. The breaker is also equipped with an incandescent electric-light plant of 200 lamps of 16-candle power.

The iron breaker is a pin-connected structure, the posts being of cast iron, the struts generally of cast iron and the tie-rods of wrought iron. Most of the large beams are riveted plate girders; the smaller are rolled iron. There are three large lathes or truss girders. The pockets for the prepared sizes of coal are eight in number, and there are two loading chutes. The plane on which the coal is hoisted carries the tracks for the cars. The main structure, or that part of the building which contains the machinery is built immediately over the pockets. The foundations under the whole breaker had to be put in with great care. The grating screens, jigs (which we have previously described) and all the other separating and cleaning machines are in this building. There are no dark corners in the breaker, particularly around the machinery, which is very accessible. All the stairways are of iron, as well as the gangways and platforms.

The height of the breaker from the railroad track to the peaks of the roof is 91½ feet; to the dump, 79 feet. The greatest amount of coal that has been passed through and cleaned in the breaker is a little over 260 tons per hour.

FIG. 2.—VIEW OF BREAKER FOR PREPARING ANTHRACITE COAL, SHOWING SETTLING-TANK AND LUMP-CHUTE.

The Dead Blue River Channel.

In the *Overland Monthly* for December, John S. Hittell, a writer of much prominence in this State, has an article treating of an ancient gold-bearing river channel which he supposes once ran at least from Eureka, Sierra county, to Placerville, El Dorado county, a distance of 60 miles, a due south course. This is the same "blue lead" which all the early miners talked so much about and knew so little of. We had supposed that the theory of a "great blue gravel channel" sweeping from North to South along the shoulder of the Sierra Nevada had, generally, been relegated to the shadows of unproven speculation that compass and obscure the old "mother lode" theory.

Observation of the surface along the northern portion of the alleged blue channel, and some knowledge of the various worked channels, led us, long since, to reject the probability of there ever having been such a river as the early miners supposed. The reasons for such rejection are many and cannot well be made plain to those who have not observed closely the evidences furnished by the extensive explorations made since the "great blue lead" was first imagined.

As a few of the reasons it may be suggested that the grade of the supposed channel is too light—30 feet to the mile is not enough—the average grade of channels, as demonstrated by actual workings, being not far from 150 feet to the mile. In places, from one ridge to another, there is no grade at all.

If such a "blue channel" had ever existed, it would be reasonable to suppose that we should find tributary streams putting in from the west as well as from the east. This we do not find. Every channel lying to the west of the Downieville-Placerville line grades southwesterly, away from the supposed channel, and this grade was not caused by elevation of the country, because these streams all ran southwesterly—that being their general course, as is shown by the "shingling" of flat rocks on the ridges, etc.

No necessity exists for such a channel as imagined. It is not conceivable that the drainage system of a mountainous section could have so been shaped, there being nothing like it known. It can be shown, conclusively, that many, if not most, of the gold-bearing gravel channels had their sources to the eastward of the line of the "dead blue," and can be traced to the westward of that line.

The ancient system of drainage, as exemplified by the dead rivers, has its almost exact counterpart in the live mountain rivers and their tributaries, differing only, as they would naturally, from one being only a few hundred feet below the average level of the country, and the modern two thousand feet below on the suggested line. The apparent suggestion of a channel running south is disposed of by observing that a line drawn from the North Yuba at Downieville to the south fork of the American river near Placerville will just touch the hot-toms of all the larger streams between these points, giving exactly the grade given to the "dead blue." Suppose these streams filled with gravel and covered with mud lava; suppose sufficient time to have elapsed so that what are now main ridges of bedrock have been eroded to a point two thousand feet below the present main streams, we should then have a series of ridges capped with gravel, extending from Downieville to Placerville, the bedrock underneath which gravel showing exactly the grade now given the "dead blue," and the geologist of that age would be in possession of the same evidences that a great river ran north to south along the range ages before the destruction of humanity by fire, that present investigators have of the existence of the "dead blue" running in the same direction during the pliocene period. If not, why not?

We do not lay claim to much geological knowledge, but observation, extending over a period of 30 years, has convinced us that during the latter part of the pleistocene period, water ran down hill. Given a range of mountains extending in a south by east direction, auriferous quartz ledges, plenty of water and time, and nearly all the phenomena of the deposition of gold and gravel in the pleistocene formation is "present or accounted for." At the beginning of the time when the gravel was deposited, the western slope of the Sierra was, almost beyond question, an uneven plateau, inclined to the southwest, with no deep depressions or high elevations, locally speaking, but as a whole, much more elevated above the sea than are the main ridges to-day, seamed with gold-bearing quartz veins. Then the rains and snows fell and the process of erosion, which formed and filled the channels with quartz gravel, began.

This erosion continued until all the gold and gravel that we find in the dead rivers was laid down just as we find it to-day. Then there came a change. From somewhere to the eastward came vast quantities of mud, which we call pipeclay, and filled the channel of the larger streams at least. That was the end of the so-called pliocene channels as factors in a drainage system. From that day to this, they have remained a sealed page in the book of the universe. Either at the time, or soon after the flow of pipeclay, some slight tilting of the slope occurred—just enough to cause the drainage of this section to tend more to the south, and form new channels, which cut the older channels at various angles. Later, the water from some cause, now unknown, tended still more to the eastward, forming a third drainage system that

cut away the channels of both preceding systems, in places. No pipeclay overlies either of the two secondary channels.

In the fullness of time, a great pouring of mud lava took place, filling all the depressions, but not covering of ridges between the streams. Afterward, from causes not known to us, the waters that fell upon the just and upon the unjust began to find their way to the sea along the line of parting between the lava and the bedrock, and the latter being the softer, wore more rapidly than the former, until it came to pass that the waters of the principal streams ran south of west instead of west of south, as at first, and they continue so to run to this day. While the foregoing may not be applicable to every locality in every particular, it is the story revealed to those who inquire within and without along the lines of development in this county during the past 40 years.—*Mt. Messenger (Sierra Co.)*

Vertical Mining Shafts.

In mining in the Grass Valley district, says the *Union*, it has been the prevailing custom to sink inclined shafts on the quartz veins for greater convenience in prospecting and extracting the ore. This has also been considered to be the most feasible plan as the veins as a rule are not wide, and the "country rock" is generally sufficiently hard to start without expensive timbering. This mode of mining will continue in the future, but it is becoming evident that in very deep working it will become a matter of economy to sink vertical shafts. Take for instance the North Star and Empire, where the inclination of the veins do not exceed 30 degrees. The shaft of the first named mine is now nearly down to the 2300 foot level, and yet the vertical depth will be less than 800 feet. The Empire is down to the 2000 foot level, with a vertical depth of say 650 feet. This necessitates a long line of pump columns, and a severe strain on the pump rods, which makes an exacting service upon the machinery, which would be materially lessened if the mines were provided with vertical shafts, and would also be a saving both in time and money in pumping and in hoisting the ores to the surface. The experience of the last few years has been favorable to deep mining in this district, which has given mining men new and more progressive ideas as to the value and permanency of the district, and they realize that they must improve on the old modes of working by minimizing expenses. Take as an example the North Star mine. By the first of the coming year there will have been four new levels opened within thirteen months time, which represents the sinking of 400 feet in the shaft. Should a like amount of sinking be done next year the 2700 level would be nearly reached, and it is evident that the powerful machinery would be taxed to the utmost, and additional expense for heavier machinery would have to be incurred, or else a vertical shaft sunk. It is altogether likely that the latter will be done, as whatever the first cost of the improvement, it will eventuate in a large saving, as well as facilitating all of the under ground operations. It may be accepted as a fact that in deep working in this district the time is not distant when the operating of mines by means of vertical shafts will be a popular mode of mining.

RAILROAD AND LAND GRANTS.—Secretary Noble, in his annual report, says: The matter of the adjustment of railroad land grants, as contemplated by the Act of March 3, 1887, says the report, presents for decision many varied and important questions, and from the numerous interests presented and the large values involved, much care and research are necessary for a proper disposition of the same, and from the magnitude of the work, progress is necessarily slow. The chief causes of delay are lack of surveys and the mineral complications—that is, the actual conditions of the lands inside railroad limits with regard to mineral deposits. The position of the department on this question is that the discovery of the mineral character of land at any time prior to the issuance of patent therefor effectually excludes such land from a railroad grant that contains a provision reserving all mineral lands therefrom. The Supreme Court of the United States must eventually settle the question. In the meantime, patents will be refused for all lands deemed to be mineral within the provisions of the statute.

THE WOODBURY CONCENTRATOR.—W. B. Farwell, Supt. of the Gold Mountain mine, Amador county, writes a letter to Geo. E. Woodbury, inventor of the Woodbury concentrator, in which he says: "The two 'Woodbury concentrators' obtained from you in August last by the Gold Mountain Mining Co., have been running steadily at Quartz Mountain, in this county, since the first week in September. Up to that time, all efforts that had been made at Quartz Mountain to save the very valuable sulphurets that are found there had resulted in failure. I am happy to be able to inform you that, with two of your machines, the mill has been run since it first started up in September with fine success. The machines save the sulphurets very closely and at a fine profit. In brief, they are a perfect success where all others have been a perfect failure. The company is now putting in ten additional stamps and will use two more of your machines, regarding them as the very best concentrators that have ever yet been put upon the market."

Amador's Gold Product.

In answer to a correspondent who asks for the names of mines which have paid dividends in Amador county, the *Ledger* has this to say: The information which our correspondent calls for is next to impossible to obtain. Most of the companies operating along the mineral belt of Amador county are close corporations. All those organized with Eastern capital, except those listed on the New York Stock Board, are of this character. The output of bullion and the amount disbursed in dividends are, as a rule, kept secret. Perhaps it would be much more advantageous for the mining interests if it were otherwise. Outside of the Plymouth Consolidated, we do not know of a mining company in the county that makes a practice of publishing the bullion production and expenses. The truth is, mine-owners here are not engaged in trading in the stocks; they look for returns for their investments to actual surrender of gold from the quartz veins. Hence there is no motive of self-interest to prompt them to make public the yield of the precious metal. The only record of the production of our mines is the annual report from the Mint at San Francisco. This report gives the total yield of Amador county for 1890 at \$1,469,000. We have already published the detailed statement, but will republish the output of those mines yielding \$10,000 and over:

South Spring Hill Mining Co.	\$251,272 25
Kennedy Mining and Milling Co.	233,123 09
Zelle Mining Co.	169,334 33
Amador Reduction Works	122,036 91
Wildman	110,262 26
Keystone	72,773 65
Bunker Hill Gold Mining Co.	58,930 13
Gover	50,510 21
Plymouth Con. Mining Co.	54,550 00
Grass Valley Plume and Hydraulic	40,000 00
Purrrington ditch	30,000 00
Lambing Gravel Mining Co.	18,571 43
River gold	16,010 00
Lincoln Mining Co.	10,000 00

The amount credited to the Amador Reduction Works must be added to the yield of the South Spring Hill, Wildman, Keystone, Gover and a few other mines, being the yield from the sulphurets treated at those works. Of the above list, at least seven or eight must be dividend-paying propositions. True, our mines have not been so prolific during the last few years as in some years in the past, but a contribution of a million and a half to the world's stock of gold in one year is by no means a poor record for a mineral region 20 miles in length from north to south. One thing is certain—it has cost far less than that sum to extract this vast yield, and this much can doubtless be said of Amador's mining history from the beginning to the present time. There are few gold mining countries of which this can be said. The Comstock vein—the mightiest bullion producer the United States has ever seen—has surrendered far less than a dollar for every dollar that has been expended. At the present time, there is not a solitary mine on that famous lode that is paying expenses. They are all assessment propositions, except the Con. Virginia, which is fast working up its surplus, and hide fair to be in the procession with the balance in a few months.

The Plymouth Consolidated has paid \$2,280,000, most of it within the last ten years. The Keystone has paid monthly dividends for nearly 30 years, some of them as high as \$40,000, the aggregate reaching into the millions. An assessment levied two months ago is the first in the history of that mine. The South Spring Hill—a mine operated by New England capital—has paid dividends for years. In its palmiest days, the owners were offered—so it was freely reported—at the rate of between one and two millions for the property—a sum far exceeding all the Eastern capital which has been expended in mining enterprises in this county. It is true, it has not yielded dividends the last few months, but there are good reasons for believing that its prosperous days will return ere long. The Mahoney, Gover, Wildman, Kennedy and Zelle have all proved paying mines. In the past year, the Kennedy has loomed up as one of the grandest mines the county has produced. In proportion to the number of stamps in motion—40—its output far exceeds that of the Plymouth Consolidated in its best days. It has paid regular monthly dividends, some as high as \$40,000. We do not see any grounds for murmuring at Amador county as a field for mining enterprise, either viewed from her past or present record. As for the intimation that our gold-bearing quartz veins are exhausted, the idea will not be entertained for a moment by those at all conversant with the situation. Our auriferous ground has merely been scratched over. The work done is not to be compared with what remains to be done. From the extent of territory within the limits of the mother lode, still untouched, it is safe to assert that there is infinitely more gold in the ground than has been taken out, and at the present rate of prospecting, half a century hence will find Amador county practically unimpaired as a contributor to the supply of gold.

DR. C. J. EAMES expects to have his San Diego steel works in operation by the first of the coming year. Negotiations have lately been completed by which iron will be shipped by water to the works direct from the Tepic-Atete mine at San Ysidro, Lower California, 50 miles south of Ensenada. The vein averages 125 feet in width and has been traced on the surface for a distance of over 2000 feet. Dr. Eames says at least 85,000 tons of metalloiferous ore is in sight, which averages 68 per cent of iron.

Mr. Mackay on Comstock Milling.

One of the witnesses in the Hale and Norcross suit last week was John W. Mackay, the well-known mining millionaire. The testimony was of interest to many.

"You have been engaged in mining many years?" he was asked.

"Nearly all my life."

"You have a large interest in the Con. Virginia mine and the Comstock Milling Co., and are acquainted with their workings, and that of the whole Comstock generally?"

"I have and I am."

"What percentage of pulp assays are returned at the Con. Virginia?"

"About 75 per cent. Sometimes it is higher and again lower."

"Has it ever been 85 or 88 per cent?"

"Frequently."

"If the car-sample assay of 1259 tons of ore averaged \$72.12, what ought the battery sample to be?"

"The battery assay ought to be \$62 or \$63."

"If the battery assay of this ore was \$40 66, you would consider it too low, would you not?"

"I certainly would."

"In working about 4000 tons of ore whose car samples averaged about \$42 and the battery only returned \$27.27, would you consider that too low?"

"There might be a little base ore in the assay, but if there was not, the battery ought to be \$32 or \$33. There should not be more than a difference of \$8 to \$10 per ton between the assays."

"If the 1259 tons were worth by our sample \$113 518 41 and the gross bullion returned was \$40,471.50, would you think it was properly milled?"

"I would not, because there is too great a discrepancy."

Mr. Baggett, continuing to read from the bullion record of the Hale and Norcross, asked:

"If in 3973 tons, whose car sample assay value was \$222,711.30, the gross bullion return was \$73,097.77 yield, would you think that the ore had been properly milled?"

"I would not. That difference is too great."

Car Samples and Battery Samples.

In reply to questions by Mr. Wood the witness said he had not owned any interest in Hale and Norcross for many years and that he based his opinion of the working of ores from the Con. Virginia mine.

"Assuming that car sample and pulp assays were honestly taken and they differ, which do you consider the best assay?" was asked.

"The pulp or battery assay. Even the assays differ and so do the battery samples."

Mr. Baggett asked if he had not known the gross output to exceed the battery assay.

"I have known it to do so—that is, the mill has returned higher than the battery assay."

"Taking an average of between 40,000 and 50,000 tons of ore would not the car samples, if properly taken, approximate the value of the ore?"

"They would."

Every one in the courtroom displayed a deep interest in Mr. Mackay's testimony.

Judge Hebbard suddenly turned to him and interrupting a question which Mr. Baggett was about to propound, asked:

"How low a grade of ore on the Comstock would it pay to work?"

"Probably \$14 or \$15 per ton."

"Then there would be a loss to the mine in working all ores under that value," said the court.

"I believe there would be."

"Mr. Mackay, what is a fair rate for milling Comstock ores where there is no contract?"

"It is hardly possible to say definitely, as much depends upon the grade and character of the ore and the loss of quicksilver. Ore that is worth \$60 to the ton costs more to mill than \$20 ore, and still lower grades can be worked more cheaply. I should say that \$5.50 to \$6 for low grade and \$6 to \$7 for higher is a fair price. Up to \$36 there is an increase of about \$1 a ton in the cost of milling."

"Isn't it a part of the compensation for working ores to appropriate the tailings?" asked Mr. Wood.

"I so consider it."

"What do you call tailings?" interjected Mr. Baggett.

"That material which is passed through the amalgamating pans."

"Does that include the slimes?"

"I consider them all the same thing."

Milling Customs.

"By what right as a millman would you claim those tailings?"

"In the first place it is a custom, and in the next, where the mill has agreed to return 65 per cent of their assays, they are allowed to retain the rest."

"Did not that custom grow out of early contracts on the Comstock, where the mill was required to return a certain percentage of mine assays?"

"It did."

"If there was no representative of the mine at the mill, could not the mill-owners dishonestly take a large proportion of the value of the ore?"

"They couldn't do it and work to the assay of the mine, but they might take it all if the ore was dishonestly worked, and no check placed upon them. It is the duty of the superintendent to exact a certain percentage of mine as-

says from the ore, and if that is not done, there is no protection for the mine."

Judge Hebbard asked what was the duty of a superintendent of a mine in the shipment of ore.

"The superintendent should have oar, hatchery and settlers made for comparison, and then see that he gets proper returns," said the witness. "He is not to look out for the shipment of bullion to the Mint."

"If you owned a mine that shipped ore which assayed \$70 per ton, and the mill only returned \$40, would you not look after it?" "I would look to it at once myself. I would not wait a day."

Mr. Biggett asked the witness as to what checks as a mine-owner he would put on a mill in which he had no interest, to which he replied that he would give no ore to the millmen unless he knew them to be honest, and as a business proposition he would see that there was not much discrepancy between the mine and mill assays, or he would know the reason why. From the general nature of the business, the mine was forced to place a great deal of confidence in the mill.

The President's Message.

The message to Congress of Benjamin Harrison, President of the United States, is a document far too lengthy for publication in our columns. A large portion is devoted to recapitulation of department reports and information already familiar to the public. Among other things, he recommends that a full trial be given to the present silver law, under which the Government is now buying and putting out of the market the equivalent of the entire production of our silver mines. He holds that the most effectual way of creating a European sentiment in favor of a larger use of silver is to accumulate gold in the United States. He does not yet find a public sentiment in Europe which will warrant him in proposing an international conference on the silver question.

The President deems the completion of the Nicaragua canal important enough to warrant the extension of aid by our Government by guaranteeing its bonds, or even by direct appropriation from the Treasury, should other means fail, of course taking measures to protect the rights and interests of the Government.

On the subjects of coast defense and navy buildings, the President is fully abreast of the Department officers having charge of those matters.

Irrigation in the arid region is treated briefly, but it is held that the danger of corporate control of water is great and that the General Government should not part with its ownership of water sources, reservoir sites, etc., either to States or Territories, except upon such conditions as will ensure to the interests of settlers.

The President recommends additional legislation to cure present defects in the Chinese Exclusion Act, especially regarding the deportation of those caught entering the country unlawfully.

On the Chilean trouble he accepts fully the theory and statements of our representatives regarding the attack upon the Baltimore's sailors, but says he has no official advice that the Chilean investigation is nearly completed, and an adequate and satisfactory response will be made. If disappointed in this, he will at once, in a special message, bring the matter before Congress for action.

A Nevada Enterprise.

The people of Nevada are gradually awakening to the knowledge that by the adoption of irrigation upon a large scale, a surer source of wealth will be found than in all the mines that have ever been discovered there. A plan is now under way for the irrigation of a large tract of land in the vicinity of Hawthorne. It is proposed to divert the water of a number of streams which at present empty into Mono lake, and to conduct them into a storage reservoir, a site for which has been found in a valley bearing the euphonious name of Whisky Flat. Below that reservoir is some 50,000 acres of fertile land that only needs the aid of irrigation to become highly productive. It is estimated that the entire work will not cost to exceed \$500,000, and it is proposed to bond the lands to be benefited in order to obtain the necessary capital.

ALONG THE COLUMBIA.—The course of the Columbia river furnishes an almost limitless panorama of entrancing views. We have adorned our columns from year to year with reproductions of camera-catches in this rich field, and yet the supply is abundant. Upon this page is a striking view where the railway passes between two vast rock-masses known as the Pillars. These are wonderful natural erections, and the lesser one compensates for its smaller stature by bearing upon its crest a forest tree of considerable size, finding nourishment in the gradual accretions of soil which rock disintegration, clouds and winged contrivances bring to its support. It is a perilous situation, but the tree has grown to it and secured a firm footing.

Mines in the Desert.

A correspondent of the *San Diegoan*, writing from Dos Cabezas, Great Colorado desert, says: This portion of San Diego county is receiving a search for precious metals at the present time unequalled in the annals of the county's history. Prospectors are daily to be seen at Indian Wells, New River and the Alimos, and at various other points where water can be got at.

The great Salton sea, at one time the country's talk, is fast disappearing and the same old desert looks as natural as usual. True the overflood has had a beneficial effect in the way of prospecting, as miners reached certain desirable points which they otherwise could not have done in the absence of water, and every prospector I have met agrees that they could not discover that phantom ship.

Signal mountain appears to be the prospective point, and in my view is the most desirable for very good reasons. I have seen some very nice specimens carrying silver in goodly quantities, and one piece shown me was as perfect a chunk of horn silver as I have ever seen. In

rigger," on the way to Portland, which will give him something to talk about with his fellow-travelers on the way when he returns.

FREE COINAGE BILL.—Senator Stewart put in his bill for the free coinage of silver last week, and it proved a very brief but very pointed document. It provides that the unit of value in the United States shall be \$1, and the same may be coined of 412½ grains of standard silver or 25.8 grains of standard gold, and these coins shall be legal tender for all public and private debts. Any owner of silver or gold bullion may deposit it in any mint, where it will be formed into standard dollars or gold coins free of charge; but it shall be lawful to refuse any deposit of less value than \$100, or any bullion so heavy as to be unworkable for the purposes of the mint. Section 3 of the Act of 1878, to authorize the coinage of a standard silver dollar, is made applicable to coinage under this Act. This relates to the issue of certificates, and Senator Stewart's bill provides that the certificates shall be of denominations of not less than \$1 nor more than \$10,000, re-

ALONG THE COLUMBIA—THE PILLARS.

fact, I am sensible enough to know that I was at one time guided to Wheeler's exploring party, under Captain Birglin, and in that capacity found some nice specimens of silver, but the Government would not wait for me to prospect, so I had to march away. The surroundings, country, ground and formation, give sure indications that quantities of silver and gold exist at Signal mountain, or in the immediate vicinity. True, so far as my knowledge extends, there has been no extensive ledge located, but it is evident that one is to be found here, as great quantities of float is to be found for several miles around the mountain, but so far it is only a matter of conjecture from whence they emanated. The developments recently made are on the American side. In all likelihood they may extend to Mexico, as the quartz to be found in Mexico is the facsimile of that discovered on the American side. A stiff upper lip, with plenty of energy, will unravel the whereabouts of the hidden treasures. I would willingly bet all my right in the world to come that it will be struck rich within three months.

Dos Cabezas and Cressas Creek have several men at work and claim that at the latter place they are taking out good rock.

MR. A. W. HAVENS, Secretary of the Consolidated Virginia and California mine, is off on a vacation trip to the northern coast. He went last week on a British sailing vessel, being nautically inclined and preferring a sailing voyage to one in a steamer. The "Admiral," as he is known among his intimates, hopes to meet with a storm while on the "square

deemable in standard coin. Owners of bullion deposited for coinage shall have the option to receive the coin or its equivalent in certificates, and such bullion shall be subsequently coined. The bill was not referred to a committee, as is usual, but was laid on the table, so Senator Stewart can call it up at any time.

MARBLE AND RICOILITE.—The Silver City (N. M.) *Enterprise* says: Prof. Merrill, of the Smithsonian Institute, Washington, has spent several days in and around the city examining the mining resources of this vicinity. He expressed himself as very agreeably surprised at the varied and valuable mineral products of this section. He inspected a mine west of Chloride Flat, which Prof. Warling classifies as that valuable mineral, ultramarine. It is only found in four other localities in the world, Persia, China, Siberia and Bucharia. Before the year 1814, this valuable pigment was worth its weight in gold, but in that year Christian Gmelin, a German professor of chemistry, discovered a method of producing an artificial compound, which now takes its place and has reduced the price from 15 to 20 cents per pound. While Prof. Merrill is the author of a standard work on architectural and ornamental stone, giving a history of them and localities where found, he had never heard of the great ricolite and marble quarries of Grant county, and spoke highly of the samples shown him. He made a trip to the ricolite quarries, and also to the marble quarries, with a view to incorporating in the next edition of his book a full and complete description of them.

The Bradford Mine Sold.

Much has been said the past month, says the *Callistogian* (Napa Co.) about the probability of the above-mentioned quicksilver mine being disposed of by the company, but nothing definite could be given to the public, as such information might interfere with the negotiations.

The mine was at first bonded to the New Almaden Co., and to satisfy them to a certain extent of the value of the property, work was done in the mine by a number of miners sent there by the New Almaden people. The developments resulting from this work were satisfactory. But when the subject was brought before the company for final action, they refused to purchase. J. B. Randol, business manager of the New Almaden Co., labored hard to induce the company to purchase the property, but they peremptorily refused to do so. Mr. Randol knew that the mine was valuable, and he told them that if they would not buy it, he would endeavor to do so himself with the aid of capitalists. With this object in view, the time for purchasing the mine was extended, and he began making efforts to secure assistance. Before the expiration of ten days, he had succeeded in associating with him for the purpose, D. O. Mills of New York and Thomas Bell, formerly interested in the New Idria quicksilver mine, and the Bradford mine, together with the real estate belonging to the Bradfords, was purchased. The amount paid for the mine we have been unable to learn, but no one opposes it to be less than \$250,000. The amount may be twice that sum. The old Bradford farm, with certain additions of real estate purchased the past few years, was sold to the new company for \$20,000.

Monday afternoon, Von Lsicht, from the New Almaden mine, who is to be superintendent of work at the Bradford mine, passed through Calistoga on his way to the new purchase, where he will probably ascertain what improvements should be made to secure the best results. Among these will no doubt be the construction of one or two new furnaces.

To-day an extra stage was necessary to convey to the mine a number of furnacemen, who are to begin work without delay. All the miners and furnacemen heretofore employed at the mine have been discharged, and will not be given employment there in the future. The expense for this is that old miners at the New Almaden must be provided for in preference to others.

The sale of the Bradford mine is the most important transaction in mining property thus far recorded for this portion of the State, and will no doubt result beneficially to all mining interests of the surrounding country.

New Incorporations.

The following companies have been incorporated and papers filed in the office of the Superior Court, Department 10, San Francisco:

MEXICAN HIDALGO AND ZARAGOSA G. & S. M. Co., Dec. 1. Capital stock, \$50,000. Directors—C. H. Chambers, J. H. Cunningham, S. R. Norton, G. Bebe and D. M. Dille.

WESTERN DREDGING CO., Dec. 1. Capital stock, \$1,000,000. Directors—C. E. Gunn, C. L. Benton, J. Bruckman, E. L. Wagner and Chas. M. Shortridge.

STANDARD QUICKSILVER M. Co., Dec. 2. Capital stock, \$5,000,000. Directors—J. B. Reinsteint, M. S. Eisner, T. E. Ryan, F. J. Fleiter and F. W. Wallace.

FINE GOLD LAND AND WATER CO. (Fresno), Dec. 2. Object, to mine, build canals and flumes, etc. Capital stock, \$500,000. Directors—Wm. Helm, W. N. Ootbort, R. B. Johnson, W. H. McKenzie and S. N. Griffith.

SAN LUIS OBISPO IMPROVEMENT CO., Dec. 7. Capital stock, \$124,000. Directors—Melville W. Regensberger, Louis Cooks, W. Grosse, R. S. Wheeler, Frederick Sigmund, L. Simon, Ernst Keiser, J. A. Miller, Wolrod Winterberg, Henry Stern and G. A. Falkenstein.

SCHOONER ALICE COOKE CO., Dec. 7. Capital stock, \$48,000. Directors—J. W. Graham, W. H. Dimond, A. H. Higgins, W. G. Hill and F. J. Lowery.

SCHOONER ROBERT LEWERS CO., Dec. 7. Capital stock, \$48,000. Directors—J. W. Graham, W. H. Dimond, A. H. Higgins, W. G. Hill and F. J. Lowery.

PASO ROBLES AND CAYUCOS R. R. Co. San Luis Obispo, Dec. 7. Object, to build, operate and construct a railroad from Paso Robles to Cayucos, about 30 miles in length, to build and operate telegraph lines, etc. Capital stock, \$700,000. Directors—George R. Adams, H. Eppinger, E. A. Stowell and O. C. Bryant of Paso Robles; M. M. O'Shaughnessy and J. N. E. Wilson of S. F.; A. F. Jack of San Luis Obispo, and J. W. Watson and A. M. Hardie of Cayucos.

FRESNO ELECTRIC R. R. Co., Dec. 4. Capital stock, \$4,000,000. Directors—Marcus Follasky, J. R. White, Fulton G. Berry, Benjamin R. Woodworth, W. F. Chandler, Dr. Lewis Leach and Morris Messinger.

SAN FRANCISCO AND EASTERN R. R. Co., Dec. 7. Object, to construct and maintain a railroad from a point in Alameda county on the bay of San Francisco, opposite the city of San Francisco, through the counties of Alameda, Contra Costa, San Joaquin, Merced, Fresno and Tulare to Hanford, and through the El Tejon pass to Rogers, in Kern county, a distance of 380 miles; also from Hanford, in Tulare county, through Visalia and Walker's pass to Indian Wells, in Kern county, a distance of 100 miles. Capital stock, \$14,400,000, divided into 144,000 shares. Directors—J. R. Howell, C. W. McAfee, W. W. Belvin, H. J. Brady and C. L. Weller.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

AMADOR QUEEN.—*Ledger*, Dec. 8: A force of four or five carpenters are at work repairing the mill of the Amador Queen in Hunt's Gulch. Mr. Graham, an expert miner, will be superintendent, and A. N. Peterson of Sutter Creek is engaged as millman. He is one of the best millmen in the State, and if there is gold in the rock in paying quantities, he is as likely to make it pay as any man that could be selected. Ten stamps are being fitted up first, and they are expected to be dropping by Christmas. The other ten will be repaired afterward. There is plenty of rock on hand to keep ten stamps going for some time. We were shown this week a gold nugget worth \$14, picked up on the gravel claim of L. Ludekens, near Aqueduct. They are ground-slucing the upper portion of the claim. The lower part is believed to be far the richer, but this cannot be worked until the Grass Valley hydraulic claim is worked out.

SUTTER CREEK.—*Cor. Ledger*, Dec. 9: Retimbering the Hector shaft is finished. They were considerably surprised to find the water standing in the shaft at the 80-foot level, showing conclusively that the pumping in the Wildman did not affect it in the least. Taking out the water has been deferred for some reason, but it is to be hoped not for long. The mill is running on surface ore yet, and they may have enough to keep the stamps in motion through the winter. Sinking at the Wildman is progressing very favorably. The fifth set of timbers is in, which takes them 60 feet. In about two weeks the 100 feet will be finished, when cutting in the foot-wall will be next in order, where they expect a ledge of good paying ore. The mill, which has been hung up for a short time, will in all probability be started up some time next week. At the Belmont, the new pipe referred to two weeks ago is made and laid in place, and the mill, as soon as it undergoes the necessary repairs, will be started. The hoist and buildings over the old Boss shaft are finished, and cleaning out and sinking in a few days will be in order. The Lincoln is still running in the usual way. The cleanup last week was the best yet made, enabling them to pay up in a creditable manner. Sinking at the South Eureka is progressing in a very satisfactory way, and everything is looking very encouraging.

Butte.

A RICH MINE.—*Oroville Register*, Dec. 10: A Paradise gentleman who was in the *Register* office lately, told us that a few days ago Col. McLaughlin and Sir Kirkpatrick visited the Magalia Consolidated mine. The gravel was cleared up and the sluices entirely free so as to make a fair test of what the gravel was yielding. The miners dug from the face of the tunnel seven carloads of gravel, which was then washed under the inspection of the two gentlemen we have named. When the earth was washed off and the riffles examined, they were found filled with gold, the pieces varying from ten cents to \$15 or \$20 in weight. As specimen after specimen was picked up and handed to the genial Colonel and his companion, a smile spread over their faces and they were very much pleased with the result of the cleanup, which amounted to a little over \$300 per car, or about \$800 for the seven carloads.

THE JONES MINE.—*Oroville Mercury*, Dec. 11: There is a bright and promising future for the Jones claim, situated at the head of Kimsbush creek. In the early summer the owners, J. R. Jones and sons and D. Reise, ran a tunnel 300 feet and found they were too high for good drainage, they ran another, and at a distance of 80 feet found good paying gravel. At this point the channel is 40 feet in width, with every indication of reaching double this width. The depth of the gravel is from three to four feet, and pays \$2 and \$3 per car.

Calaveras.

NEW SUPERINTENDENT.—*Chronicle*, Dec. 12: The superintendency of the Quaker Mine, near the Junction, is now under M. W. Beardsley, vice Thomas Goodwin, resigned. Operations have been suspended for several days past, Superintendent Beardsley having gone to the city to make new arrangements. The shaft is down 500 feet, 400 feet of which is a vertical shaft in solid rock, while the last 100 feet is an incline following the vein. A heavy flow of water was encountered at 500 feet, doing irreparable damage to the incline. We understand that the matter under consideration is the continuation of the vertical part of the shaft, which is unimpaired, in the solid rock.

FROM ANGELS.—Both furnaces at the chlorine works are in operation roasting sulphurets. The mines in operation in this vicinity are all running full handed and yielding much gold.

El Dorado.

BLAIR'S DISTRICT.—*Mt. Democrat*, Dec. 12: At the Blair mine, they have struck gravel, but the freezing of the ditch has stopped work in the tunnel for the present, and the whole force of men is engaged on the outside in carpentering and grading. Most of the machinery for a steam air compressor was hauled to the mine this week, in spite of the bad roads.

KELSEY.—*Mt. Democrat*, Dec. 12: We have the best authority for stating that work on a very extended scale is contemplated by the American River Syndicate. The perfect success of the running of the St. Lawrence mine by power electrically transmitted from the syndicate's power station at Rock creek, over a distance of five and one-eighth miles, the longest transmission for power purposes yet attempted in the United States, has demonstrated the value of such application of power to mining purposes. We believe that Mr. Cullen Pearson will now undertake and transmit power successfully over a distance of thirty miles. Mr. Pearson has left for England in compliance with a called request from the Syndicate Board of Directors, in order that he may give his views on certain points connected with the proposed enterprise. He is accompanied by his acting superintendent, Mr. W. H. Hushand. During their absence the Dalmatia mill will be closed down, the work at that mine being concentrated on the drain tunnel, and in preparing the ground for the erection of electrical hoisting and pumping gear,

as it is proposed to sink at once 500 feet, the results obtained from the surface working having been so satisfactory. Work is also being strenuously pushed ahead by the syndicate on the construction of the American River ditch. The St. Lawrence continues to run uninterrupted, and we would counsel all those interested in mining properties to go there and see the beauty and simplicity of the electrical machinery by which the entire operations of the mill are controlled. There are rumors to the effect that a most important combination of mining interests is in contemplation.

Humboldt.

PRESTON MINE SUBMERGED.—*Blue Lake Advocate*, Dec. 12: The Preston coal mine on Maple creek has been forced to suspend operations by the rise of water in that stream. It is possible that it may remain shut down until spring, though it is not clear that it has been definitely decided to wait so long. One thing is plain, that very little more can be done with the machinery heretofore employed at the shaft. A flume has been built down the creek and a water wheel placed in the creek to pump water from the mine. But the rise of the creek made it necessary to remove both flume and wheel to prevent them from being washed away. Even the mine, which is situated on the bank of the stream, has been submerged and the shaft itself is full of water. It is learned here that there is talk of ordering machinery and prosecuting operations all winter. It would be unfortunate for a mine from which so much is expected to remain closed down all next spring.

FROM HAWKINS BAR.—James McDonald reached Blue Lake Wednesday from Hawkins Bar, where the Horseshoe Bend Mining Co., of which Mr. McDonald is a member, are operating. A road from Hawkins Bar two miles to the mine has been built since September, and the company is digging a ditch to Davis Point which will be 2½ miles long. Upon completion of this work, a mill will be put up and the quality of the gravel exploited. It is expected that work on the tunnel at Horseshoe Bend, which is to be 450 feet long, will begin in the spring, but it may be deferred if the gravel at the Point pays well.

Mendocino.

QUARTZ LAND LOCATED NEAR HOPLAND.—*Ukiah Press*, Dec. 11: Hopland is now on the eve of a mining boom, and arrangements have already been made to sink a shaft. About six years ago a few business men of Hopland began mining about two miles east of the town and took out \$1200 in a short time. The tailings, however, were run on the land of Henry Willard, and he objected to the work proceeding. The matter was therefore dropped until recently. Several San Francisco capitalists, who are much interested in mines in other portions of the State, sent an expert there a couple of weeks ago. He found a quartz lead which he pronounced very rich. The four San Francisco capitalists and W. W. Thatcher of Hopland accordingly formed themselves into a company and made an agreement with S. Forester, who owns 103 acres of land where the quartz is supposed to be, whereby the former have the privilege of sinking a shaft and doing other preliminary work. If pay dirt is found, Mr. Forester is to be given a one-sixth interest in the company for \$10,000. Arrangements have been made with a Ukiah well-borer to sink a four-foot shaft 72 feet. The gentlemen interested are all men of means and experience, and they are confident that the prospecting will be decidedly satisfactory.

Nevada.

GOLD DUST.—*Nevada Transcript*, Dec. 9: Some Chinamen drifting a gravel claim adjoining the old Sargent & Jacobs hydraulic mine of Quaker Hill are getting big returns for their labor. They recently sent to San Francisco a bar worth \$7500. The bond which Fritz Meister had on the Canyon Creek quartz claim in Washington district recently expired, and the owner, Geo. G. Allan of this city, gave an extension of time. Mr. Meister, who recently returned from a trip to Salt Lake City, made the preliminary arrangements during his visit toward interesting some Utah capitalists in the property, and it is likely they will organize a company for its development. The Canyon Creek has the making of a big mine. It is located in a region famous for its big, rich and permanent deposits of gold ore. Night before last there were shown at this city some remarkably fine specimens of free gold and black sulphurets ore from a Washington district ledge located by Nickerson & Son. The Delhi, above Columbia Hill, from which property come frequent authentic accounts of rich strikes, is keeping up its record. A pound of ore taken out last week was reduced in a mortar, and gave \$40 worth of gold.

ACTIVE.—*Nevada Transcript*, Dec. 11: The business of gold mining at this city has not for many years been so active and attended with such profitable results as is the case at present. It is estimated that there are upwards of two hundred more men working here than there were eighteen months ago. The improvement in the mining industry has been gradual and founded on merit. Many new claims are being developed with encouraging results, and a number of the old ones are giving better returns than they have for a long time.

THE KNICKERBOCKER.—At the Knickerbocker drift mine, just west of town, there has been opened up within the past year a body of high grade gravel five hundred feet long and ranging in width from one hundred to two hundred feet. The deposit is increasing in width as it is followed. The dirt pays about fifteen dollars a day to the drifter. The owners have already got back the money expended in prospecting and will shortly begin to realize dividends. This claim, like most of the others around Nevada City, is not for sale.

THE HARMONY.—The Harmony Drift Mining Company has decided to purchase from George G. Allan the ten-stamp mill required for crushing the quartz gravel found in the channel, and will shortly have the stamps dropping. Nuggets of varying size, some containing as high as two dollars worth of gold, are frequently found, and by the washing process alone these go upon the dump intact. The mine has for some time not only paid its current expenses, but paid for expensive improvements such as putting in water and pumping machinery, besides furnishing a surplus which is applied to the reduction of the debt incurred in starting up.

THE GOLD FLAT.—The company that recently commenced reopening the old Bruce B. Lee shaft on Gold Flat will by the end of this week have the

retimbering and enlarging finished to a depth of one hundred and sixty feet, below which point the formation is such that no timbers are required.

PIONEER REDUCTION WORKS.—Fred W. Bost is having a new furnace and tubs put into the Pioneer Reduction Works, which have been idle for six months past, and will be ready within two weeks to work sulphurets by the chlorination process.

THE CHAMPION.—The Champion Co., which has well equipped chlorination works for the reduction of sulphurets from its own mine, proposes to soon resume operations in that department. The mine is doing better than ever before.

THE PROVIDENCE.—The new company engaged in reopening the Providence mine, which has for years held a place as one of the highest and richest gold mines in the State, is crowding the work of preparation to the utmost. The overhauling and replacing of machinery, setting of pump columns, etc., is nearly completed, and within the next ten days everything but the mill will be running in full blast. The shaft is to be continued downward from its present depth of twelve hundred and fifty feet. A crosscut is to be started westerly from the twelve hundred and fifty level to tap the back ledge which the old company worked from the six hundred level. It is expected the new crosscut will catch the ore vein within a distance of about five hundred feet from the shaft.

Plumas.

DRURY AND PACIFIC.—*Plumas Bulletin*, Dec. 10: The cluster of mines commonly known as the Drury and Pacific mines, situated at the head of North canyon, near Greenville, have developed into a very important and profitable business enterprise. About two years ago, Messrs. Standart and McGill bonded the first named property from J. R. Drury, and began development work and the extraction and milling of ore. From the profits thus obtained, they purchased the Drury mine about a year ago. With it were then combined the Pacific, the Forest King and the Kettle quartz mill, controlled by Mr. Standart. It was then that the new owners began a systematic development of the property by driving tunnels into the mountain, on the veins in the Drury mine and in the direction of the other properties lying to the northwest. It certainly looks as if this mining property would develop into one of the most extensive and important in this part of the State. Its success argues a great deal in behalf of the quartz interests in that part of Plumas. With a mill situated at the favorable point intended for its location, the ore can be extracted and delivered into the mill at a very small cost.

SINKING COMPLETED.—On Monday evening, the last sound of holes was fired in the bottom of the shaft of the Crescent mine, marking the completion of the "sump" at the new 400-foot level. Drifting will at once begin, and the extraction of ore and starting of the mill to crushing is expected soon to follow. The former workings in this great mine, which have extended over a period of 35 years, and yielded immense sums, have all been above the 200-foot level. This fact being taken into consideration, the importance attached to the opening up of this second level becomes apparent, and marks a new era in the history of the property. Mr. A. G. Swan came up from Granite Basin last Friday, and he reports good results from the milling of ore from his mine there. With his five-stamp mill, he crushed 26 tons of ore, and secured 38 ounces of gold, worth \$77 per ounce. Two men extracted the ore, fitted up the mill and did the crushing, all in two months. Mr. Gould is mining on Mt. Creek, about three miles from Quincy. He is engaged in drifting, and has good prospects. Next spring he will open up a large stretch of channel. Jo. Peppin of Granite Basin will fix up his tramway, and run ore direct from the mine into the mill. He has a two-foot vein of good ore.

CRESCENT MILLS.—*Plumas National*, Dec. 5: Crescent Mills has an active appearance, and with the present outlook, it bids fair to be the liveliest town in Plumas. The Green Mountain mine is running 30 stamps on rock hauled from Bachelors' old dump of 30 years ago. This rock pays well. The Crescent Milling Co. are pushing their prospects, and Mr. Whitney expects soon to have the mine in fine working shape.

HUNDRED DOLLARS A TON.—*Oroville Register*, Dec. 13: Joseph Willett of Brown's Hill, just over the line into Plumas county, was in Oroville yesterday. He tells us that he is running a tunnel on his quartz ledge, and that the rock looks exceedingly well. The lode is four feet wide and the whole ledge prospects well. It is not a chimney or pocket ledge, but the rock is very rich and he thinks much of it will go as high as \$100 a ton. Mr. Willett has a good gravel mine, but owing to the high altitude he can only work it a short period when water is plentiful from the melting snows.

San Bernardino.

GYPSUM.—*San Diegoan*, Dec. 8: The 200 tons of gypsum piled up on the Santa Fe wharf, awaiting shipment to San Francisco, demonstrates two facts—one, that the vast mineral resources of this and other Southern California counties are being brought to the notice of the commercial world; the other, that San Diego harbor is the only outlet by sea through which any shipment of any kind can safely be made. The 200 tons of gypsum now awaiting shipment is not the first which has passed through this port for the north. For some time past the Ventura Crystal Plaster Co. has been sending on an average of two cars per day to this city from their mines at Rincon, near South Riverside. This company owns large deposits of this mineral near Riverside, and is reaping a good profit from its sale. Throughout San Diego county there are deposits of gypsum equal to any in other parts of the State, and await an enterprising individual or company to work them.

San Benito County.

OIL WELLS.—*Hollister Advance*, Dec. 11: Mr. A. W. Drumgold has struck a bonanza in an oil well in the Vallecitos valley, forty miles south of Hollister. The name of the well is San Carlos No. One. The well is eight inch bore, 106 feet deep, and 900 gallons of oil are pumped from the well every eight hours. The well is located on Sec. 8, T. 17 S., and in the opinion of experts the whole region abounds in oil. Mr. Drumgold is now in the city making arrangements for the sale of oil to dealers, and also for the purchase of 1½ miles of pipe to pipe the oil from the well to the county road. An analysis of the oil shows it to contain 77 per cent. of kerosene, which is a first-class showing.

San Diego.

HELVETIA.—*Julian Sentinel*, Dec. 10: The Helvetia force has succeeded in reaching the goal of their desires, the old works. These were cut into Friday night and the shift was laid off to allow the foul air to be cleansed away. Upon entering the old works, the quality and quantity of ore in sight was found to exceed the expectations of those interested. This is now a great property with the big pay shoot, encountered in their search for the old works, and the body of ore found to exist in the old works. This mine now takes front rank in the many good properties in the Julian mining district. The question for the Helvetia people now to solve is how and where to get more water. The present supply of water is only sufficient to run five stamps eight hours a day, while there is ore enough coming up the shaft to keep ten stamps busy every moment. At no time in the past has the prospect of a paying future for the Cincinnati Belle been so good as now. The shaft that the Murphy Bros. contracted to sink from the lower level has been progressing rapidly, and recently opened up a rich vein. The gold-bearing part is nearly three feet in width, and it is estimated will run as well, if not better, than any ore heretofore taken from the mine. The Ruby M. and Co., in addition to the men employed at the Ruby, has placed a force at work on the Wilcox mine. Charley Barnett has been having 15 tons of the Hidden Treasure rock run through the mill.

San Luis Obispo.

SANTA ROSA PETROLEUM CO.—*San Miguel Messenger*, Dec. 13: A company under the above title has organized and will commence prospecting for oil at an early date on Santa Rosa creek, in the region south of Cambria, in this county. This company has leased several thousand acres of land for a term of years and proposes to commence operations at once. A gentleman who has had years of experience in boring for oil in the East, informed us yesterday that the surface indications are the best he ever saw anywhere. The company has secured the services of A. C. Massey, and he will take his drilling machine over at once. We hope to be able to report interesting developments before long.

Santa Clara.

NEW ALMADEN MINE.—*Cor. San Jose Mercury*, Dec. 9: There is no good in disguising the fact that the halcyon days of New Almaden are over, for trouble we have in the most palpable form—palmy days are of the past, and, alas for many, misery ahead. Men that have labored here for 30 years, and their children that were born here, have now to leave and are leaving by the score. They are totally ignorant of the ways of the world and have to seek new fields for labor, but the manager of the mine has done all possible for the well-being of those that are obliged to leave. Money, food and raiment has been liberally bestowed so as to give all a start outside of Almaden. Such generosity is unprecedented. Kindness of heart figures in the matter, for gifts by the company may be considered generous; but the personal gifts of the manager, J. B. Kandel, were most generous. My readers will hardly realize the number of indigent, lame, halt and sick of a mining camp of 1500 people. I assure you there were many, and to suitably clothe and put coin in the pockets of these, many took a large sum of money—more than you dream of—and yet it was done. Everything must have an end—even the great New Almaden quicksilver mines. The end has almost been reached, and yet there are many here who hope for some new discovery that may give new life to the mines. The exodus has caused a severe damper on the spirit of the camp, from which it can hardly recover. All this is caused by the poor quality of the ore mined and the absolute necessity of reducing expenses to keep the mine afloat.

Shasta.

TEXAS CONS.—*Shasta Democrat*, Dec. 9: There is some probability of another big mining deal being consummated between now and the 1st of January. An option covering that time was given to San Francisco parties, some days ago on the Texas Consolidated of Old Diggings for \$340,000. The Iron Mountain mine and mill will be closed down next week for the winter. During the winter some repairing will be done on the reduction plant. Jim Salla was in town Monday and remarked that his company contemplates moving this plant to the river, and in fact, a route for a road from the mine to the proposed new mill site has been surveyed, and the route found to be practicable and on an easy grade. The mill site on the river was secured some months ago.

Siskiyou.

STRINGER OF QUARTZ.—*Yreka Journal*, Dec. 9: Arthur Scheld and Clarence Davis of this place struck a very rich stringer of quartz last Thursday, at the head of the North Fork of Greenhorn, almost at the top of the divide, near head of Humburg creek, running down on opposite side. Next morning the claim was covered by about 16 inches of snow, with probability of considerable more snow right along in that elevated locality, which may prevent further work until spring.

WATER.—The recent snowstorm will prove highly beneficial to our mining industry, by supplying an abundance of water for hydraulic, placer and quartz mining, as soon as the weather moderates or warm rains occur. Besides filling the ditches and small streams with water for ground-slucing, a good head of water will be obtainable in running all the quartz-mills to the utmost capacity in crushing quartz on hand.

RIVER MINERS.—The river miners on the Klamath still continue operations as usual, the cool weather lately having lowered the stream, though the heavy rainstorm of Monday night on top of the deep snowfall of last Thursday, may cause a sudden freshet to shut off river mining by flooding the dams.

Tulare.

MINING OPERATIONS AT MINERAL KING.—*Visalia Delta*, Dec. 10: Wm. O. Clough of Mineral King was in town this week, accompanied by Misses Ada Glenn and Hilda Clough. In speaking about the mining operations, he said to a *Delta* representative: "Considerable assessment work has been done this year at Mineral King, and higher grade and finer grained ore has been found in the following mines: Lady Emma, Empire Discovery, second extension, Young America, and a mine that belongs to John Edwards. I have sunk a shaft 65 feet on the Pinnacle and drifted eight feet, and have struck antimony and a little free gold. The ledge has been

struck to the lower Empire tunnel, and indications are good for a big mine. The ore is well filled with mineral, and is supposed to be rich in silver, and contains iron. The tunnel is about 600 feet deep. The Lady Emma is a fissure vein, and runs east and west, then widens as we sink. There are two veins, 100 feet apart, and are supposed to come together at a depth of a few hundred feet which make an immense body of ore. The capping is iron, and is about 20 feet wide. Fine galena is found in this claim, and is supposed to be the mother lode of the district. An effort should be made to sell or bond these mines to parties that have enough capital to work them, for they are all fine prospects.

Tuolumne.

TUNNEL.—Tuolumne Independent, Dec. 12: The tunnel of the Connelly mine, near the Deadhorse, is now in 100 feet. The ore found in the shaft went \$35 per ton. The Experimental mine near Columbia, owned by the Engelke Co., has been bonded Mr. Whorf. Ten men were put to work Tuesday. The old Shanghai mine on Yankee Hill, which has produced considerable wealth in years past, is to be re-opened. It is said that E. C. Loftus will be the manager. Ore is now being hauled from the Carlotta mine at Cherokee to the Platt & Gilson mill at Soulsville. This mine has produced very largely in the past. The ore goes about \$100 per ton. The Deadhorse mine, now known as the Eureka Consolidated, has been idle for a month past, on account of scarcity of water. The mill has also been idle. Work was resumed one day this week. The Engelke silver mine at Silver Mine Gulch, American Camp, is very rich. There are now between 175 and 200 tons on the dump, picked specimens from which went \$600 in silver and \$200 in gold. The tunnel at the Oakland mine, Yankee Hill, is now in 670 feet, and within 150 feet of the chute. The ore is low grade, but can be profitably handled. The chute will be reached within about three months, when the mill will be again put in operation. L. B. Hargrave, James Boyd and L. S. Hargrave have opened a mine on the Tuolumne river, opposite Moffitt's bridge. The vein is on the mother lode, 60 feet wide, and assays \$9 per ton. The owners claim that they can work their ore for 50 cents per ton. About 50 tons of ore are now on the dump. The company expects to put in a 60-stamp mill, and a concentrator. The Redding & Lyoch mine, on the Tuolumne, near the Buchanan, has been worked very quietly. Recently the statement has been given out that the vein is five feet in width at the surface and averages seven feet to the 350-foot level. The rock goes from \$14 to \$30 per ton. The Badger mine was bonded on Dec. 12, 1890, for \$8000, by A. B. Tryon, J. M. Palmer, S. J. Mayock and A. L. Ellis. George Stayton was put in as superintendent, and at once began to develop the mine. The prospect was satisfactory, and on Friday of last week the money was paid and the title passed. Work will now be prosecuted more vigorously. Mr. Stayton will continue as superintendent.

NEVADA.

Columbia District.

CANDELARIA.—Walker Lake Bulletin, Dec. 9: Reports from Candelaria are to the effect that there is no likelihood of an agreement between the men and managers. Nearly 100 men have left Candelaria since the 1st, in search of employment elsewhere. The company boarding houses have shut up, and the outlook is rather gloomy for the winter.

Go.umbus District.

CLOSED DOWN.—Cor. Virginia Enterprise, Dec. 13: Our little town has lately experienced one of those changes that mining towns generally are subject to. Both the Holmes and the Mount Diablo mines and mills were closed down on account of a disagreement between the employers and the employees about wages, which were, up to the time of the shut-down, \$3.50 per day. The miners refused to accept a reduction therefrom of 50 cents per day, which the companies thought necessary on account of the low price of silver. A few men were retained after the 1st, and are being paid full wages for their time of cleaning up preparatory to the final closing. The discharged men thought of leaving the place after the mines closed. A good many have gone to Tule district.

Oneota District.

FURNACE CANYON.—Walker Lake Bulletin, Dec. 9: Last week a Bulletin reporter visited the mines in Furnace or Hutch's canyon. The mines are in Oneota district, Esmeralda county, about 18 miles northeast of Benton, which is unquestionably one of the most inviting fields for the prospector in the State. As a general thing, the ledges are small, but not unfrequently they widen to several feet. The ore is blue bromide and black ore, and is all of high grade, running from 100 to 2000 ounces to the ton. At the present time there are but 23 miners working in the canyon on four or five claims. In this canyon is located the famous Indian Queen mine. Many years ago an Indian found a rich piece of float rock and took Wm. Witherell to the place where he found it. Witherell followed it up and soon unearthed a ledge from which upward of three millions of dollars were taken. Adjoining the Queen is the Poorman. It is, perhaps, the most valuable claim in the district at present. Wm. Witherell, Fred Buecher and Robt. Somerville are the owners of the Poorman. After running a tunnel several hundred feet, they are into a ledge of rich ore, but the Indian Queen Co. placed an injunction on them prohibiting them from extracting the ore. The case is now being tried before Judge Rising. About quarter of a mile west of the Poorman is the Diana, owned by Bobby Roberts and Dickey Morgan. A shipment made, a short time since paid up all old debts and laid in a big supply of grub, tools, etc., and there is now a carload being worked at the Soda mill, which will give the boys a snug bank account. Pat Gilfoyle has been in the canyon for many years. He has five locations, and keeps pegging away faithfully. Adjoining the Diana on the west is the Railroad claim, owned by John Smith. Mr. Smith has done considerable work on his claim but at intervals he has been obliged to quit work on the mine in order to earn money by day's pay to keep himself in supplies. He left last Wednesday for the canyon with grub enough to run him all winter. He has already got the ledge in his tunnel. Next to the Poorman, the best mine in the district is believed to be the Isabel, owned by Henry Garner and Louis Williams. They have a 10-inch vein of ore that mills from 200 to 500 ounces, and

our reporter was told that they can easily extract \$100 a day for each man now employed. The old Coalburner mine is being worked by Tommy Rath. A stream of pure mountain water flows through the canyon and the hills are covered with pine and mahogany timber. Water costs nothing and wood is piled at the cabin door for \$3 per cord. Altogether this district bids fair to be a busy place next spring.

Oceola District.

A MAMMOTH NUGGET.—Grass Valley Telegraph, Dec. 9: One of the largest nuggets yet found in any hydraulic mine on the Pacific Coast was discovered on Sunday morning, November 29th, in the placer claim at Oceola, Nevada, of which J. H. Marriott, formerly of North Bloomfield in this county, is the superintendent, remarks the Nevada City Transcript. It laid on a high point of a big rock, and was covered with only one foot of natural gravel. Its maximum thickness on one edge is 1 1/2 inches; on the opposite side 2 1/2 inches. On the flat side its greatest width is 4 1/2 inches and its greatest length 7 3/4 inches. Its weight in the air is 146.1 ounces Troy, its cubic contents 41.1 inches, and its estimated coin value \$2200. A letter from the mine says they have completed their season's work, everything being frozen up. During the past season the claim has yielded a number of nuggets ranging in value from \$10 to \$500, but the one washed out on the 29th ult. caps the climax.

Taylor District.

ARGUS.—Pioche Record, Dec. 5: News comes from Taylor, Nevada, that eastern capitalists, through the mediumship of A. C. Cleveland, are negotiating for the purchase of the Argus works and group of mines. Through the instrumentality of Mr. Cleveland, an option has been taken until the 15th of January and "Jack" Wheatly placed in charge of the property until the expiration of that time. It is to be hoped in behalf of the town of Taylor that the proposed purchasers will get the property. The past history of that mill is that when running it was conducted in a very loose and unsatisfactory manner. It is believed that the property properly handled is a good paying proposition.

Tule District.

A REGION OF RICH LEDGES.—Cor. Virginia Enterprise, Dec. 13: News has been coming to Candelaria about strikes made in Tule by men who had been prospecting in that part of the county. Jack Manie had struck a large body of rich silver ore there very near the surface. Jerome Vidovich had some of the ore milled at the Candelaria Company's mill, and received over \$1000 as a net result for 33 days' work at Tule. His first-class ore yielded 796 ounces and his second-class ore 300 ounces of silver per ton. Others also struck rich silver ore, and as proofs were arriving here in the shape of shipments of ore, most of which was milled here with excellent results, the discharged men began a move on Tule. While this was going on, one of our townsmen, Milo T. Plamenaz, arrived with the good news that he had struck a body of rich ore in the main shaft of the St. Louis mine at a depth of 114 feet. To understand the importance of this strike, one must also know that the St. Louis mine is the oldest located claim on the ledge of the same name. This ledge is easily traced on the surface a distance of over 5000 feet, and the whole length of it is located by different individuals and companies, all of whom are taking out rich ore from near the surface. Among these is Dave Wogan, who is taking out very rich ore at the north end. Dick McNaughton and Charlie Snapp got out a shipment of ore that milled at the Mount Diablo mill at Soda-ville 642 ounces per ton. Next, in a southerly direction, is Bob Robinson's location, at present leased to Adolph Longabaugh, who is also taking out rich ore. Next southerly lies the Good Hope, owned by the Plamenaz Company, which also owns the St. Louis mine, the most important one on the ledge. Still farther south is the South Extension, owned by Spratt & Tracy, leased to Hill and Nidovich, whose shipment of first-grade ore milled 796, and second-grade about 300 ounces, as already stated. Next southerly is Jerome Ferrier's claim, whose rich strike was heralded by Charley Akin and created a great deal of excitement all over that region, resounding clear to Candelaria. Jack Manie's ore shipment, which is expected to arrive here within a few days, assays in the thousands. All these mines are being opened up with but small outlays of labor or other expense, the ore appearing near the surface. This fact left it an open question as to what extent it went downward until Milo T. Plamenaz solved the problem by striking a still richer deposit at 114 feet. Many of our unemployed miners are preparing for a trip to that part of the county, and it is confidently believed that ere spring shows any signs our men, one and all, will be the owners of rich mines in Tule.

Wahoe District.

CON. CAL. & VIRGINIA.—Virginia Enterprise, Dec. 13: 1100 level: The west crosscut, No. 1, started from the south drift at a point 100 feet south from the shaft station, has been extended 48 feet; total length, 473, the first 136 feet being in vein matter and the last 12 feet being in quartz of low assay value. Have continued to prospect the ground between the east crosscuts Nos. 4 and 5, and saved therefrom a few tons of milling ore. From the south drift at a point 40 feet south from east crosscut No. 4, a southeast drift was started and advanced 40 feet in porphyry and quartz, carrying a low assay value. 1650: Have continued to extract ore of fair quality from the drift run west from the top of the upraise carried up 50 feet above the south-west drift. Ore of fair quality has been extracted from the drift run east from winze No. 3, 73 feet down, in working upward from that point, 1750 level: In working out and upward from the bottom of winze No. 2, sunk from the 1650 level, we continue to extract ore of fair quality. Have also extracted some milling ore at the point where the upraise carried up from the crosscut run west from the southwest drift made connection with the stopes on the eighth floor. Have continued to extract ore of average quality at the point where the upraise from the southwest drift, 70 feet north from the south line of the California ground, connected with the eighth-floor stopes. The east crosscut No. 2, 84 feet south from the east crosscut No. 1, has been extended 28 feet; total length, 45 feet; continuing to show some low-grade ore. At a point 55 feet south from east crosscut No. 2, an east crosscut, No. 3, has been advanced 12 feet in the old stope and fillings of paying value have been extracted therefrom. The

station on the northwest drift has been completed, and an engine put in place, and the winze No. 2 has been sunk eight feet in porphyry and quartz. 1800 level: Are making some repairs by grading and timbering to the drift run north from the bottom of winze No. 1, sunk from the 1750 level. There has been extracted from all parts of the mine during the week 819 1300-2000 tons of ore, of which 437 350-2000 tons was shipped to the Morgan mill, and 382 950-2000 tons to the Eureka mill. The average assay value of all the ore worked at these two mills during the week was 1110 tons at \$24 per ton. Bullion shipped to Carson, assay value, \$14,202.83.

OPHIR.—1465 level: Have continued our prospecting work in the openings leading from the point where the upraise from the sill floor of this level connected with the drift run west from the winze 122 feet below the sill floor of the 1300 level, and have extracted therefrom and raised to the surface during the week 45 tons of ore, the average assay value of which is \$22.50 per ton. 1550: The shaft men have resumed work in making necessary repairs in and about the shaft.

MEXICAN.—On the 1465 level the winze started at the end of the crosscut run west from the north lateral drift at a point near the south boundary line of the mine, 132 feet in, has been sunk 11 feet, total depth, 70 feet; in porphyry carrying lines of quartz, showing little value.

UNION CON.—On the 900 level the joint Sierra Nevada and Union Con., west drift from the shaft, has been extended during the week 34 feet; total distance west of the shaft, 1494 feet; the last six feet being in porphyry.

GOULD & CURRY.—200 level: All work in south drift, 45 feet from the top of the upraise, has been discontinued for the present. At a point in east crosscut No. 1, 85 feet from top of upraise No. 1 from 300 level, started a southeast drift No. 2, on a small stringer of quartz that shows some value, and extended some 15 feet. Main north drift, 65 feet above 200 level, has been extended 25 feet through porphyry, clay and quartz; total length, 110 feet.

BEST & BELCHER.—1000 level: Upraise No. 1, has been carried up a distance of 16 feet through soft porphyry and seams of clay and quartz; total height, 80 feet.

ARIZONA.

THE COPPER CAMP.—Prescott Courier, Dec. 11: Geo. H. Curry, who recently returned from the great copper camp at Jerome, thinks there will be a town of at least 2500 workers there by spring; says the roads are getting rather slippery for teams, and great efforts are being made to complete the tramway before the winter snows set in. It is claimed the tramway will be completed within 30 days, when five more stacks will be added to the smelters. The roasting heaps extend from the smelters one mile and a half in length. Five men knock down sufficient ore in the mines to keep the whole works running at present; balance of force of miners are kept busy doing development work.

EUREKA.—Paul Dillon, one of the owners of the Parnell mine and mill, Eureka district, came in yesterday from that mine, and states that the mill had been entirely completed the day he left, and would be started in a day or two afterward, the finishing of a trestle from the lower tunnel to the mill requiring that time. Several hundred tons of ore are on the dumps, and thousands of tons more ready to be stoped out. The mill will be kept going steadily.

DAKOTA.

MICA.—Deadwood Pioneer, Dec. 8: We are reliably informed that the "mica" interests of the Southern Hills are again attracting attention and that active operations will soon be resumed on properties that for some time have not been making an output. There can be no question but that the mica mines of the Black Hills will pay well for the working, as the production is of a grade that is in general use and can be cheaply mined and marketed.

LOWER CALIFORNIA.

SILVER MINES ON THE GULF.—Lower California Dec. 5: Skipper Grosse was at the San Juan silver mines on top of San Juao mountain, near the gulf, two or three weeks ago. He found the mines and works in a flourishing condition, and the owners, the Cranz brothers, expecting to put on a much larger force of men. The skipper was surprised to be able to speak by telephone to his friends at Las Flores, 12 miles distant on Los Angeles bay where the mill is located, and to which point all the ore is packed by mules down a very heavy grade. The enterprising Cranz brothers are going to do away with this mule-killing work, and construct a tramway down the mountain at considerable expense. Surveys are now being made for this work. Four miles from the Cranz mines is the Florida silver mine, which will be worked as soon as the mining deputation goes down from Ensenada to give possession, that district being now under the jurisdiction of the authorities at this place. Another silver ledge has been discovered at Santa Ana, midway between the Pacific and the gulf, and is being developed, with good prospects of showing permanency. Discoveries of mines are becoming common in that section.

ALAMO.—A depth of 173 feet has been reached in the Princess mine at Alamo, but the drill is still in granite. A small pay streak was encountered a few days ago, but it did not last long. Crosscutting is still continued in the 100-foot level. The Aurora is a few feet deeper than the Princess, and doing well. The Manzanita mill is doing a little custom work. The El Paso mill is not running at present.

NEW MEXICO.

GOLD.—Southwest Sentinel, Dec. 11: The Pacific Gold Co.'s mill at this city run steadily last month, crushing about 1050 tons of ore from the Pacific mine. Nearly all the gold bullion shipment last month was from this mill. The Steele Rock Mining Co. is pushing work upon its Jim Crow mine, which is looking more favorable than ever. The Anson S. mining company's smelter at Hanover will blow in to-morrow. With 300 tons of ore on the dumps and a full force working in the mine, heavy shipments of copper matte will soon be

made. H. J. Hutchison of Central has booded his one-half interest in the Jim Fair group of iron and copper mines at Hanover to John Brockman for \$5000, a cash forfeit being paid. The Grant County M. and M. Co.'s lease on the Uncle Sam mine, at Cow Springs is a bonanza. Ten men are working at the mine. A thousand-dollar brick was molded at the Bremen mill from the ore on Saturday last. O. Bulow is in from Bald mountain and reports encouraging prospects on his Big Blossom mine. The vein is a very large one, being 14 feet in width, generally low-grade, but on the hanging-wall there is a four-inch streak of \$1000 ore, from which a two-ton shipment will be made in a few days. The bullion shipments from Silver City during the month of November aggregated \$24,925.

OREGON.

ANOTHER WHITE SWAN YIELD.—Bedrock Democrat, Dec. 7: Another output of the White Swan mine was brought in to the city yesterday and deposited at the Baker City National Bank by Mr. William Mulkey, one of the owners. The amount was sixty-eight and one-half ounces, or about \$300. Mr. Mulkey, when seen by the reporter, was in his usual good spirits, and observed that the White Swan was far from petering out, as he termed it. He said that timbering had been commenced in the mine, and the ledge at this time showed a width of fifteen feet, one wall having not yet been found.

CORNUCOPIA DISTRICT.—Bedrock Democrat, Dec. 7: Messrs. Carey and Pierce gave the following account of the operations on the various properties in that district during the past summer: The Oregon Gold M. Co. has put in a chlorinating plant and is working it to its fullest capacity. The concentrates are being successfully treated, saving 93 per cent. There are 400 tons of concentrates in the mill, and it is the intention of the management to increase the capacity of the plant in the spring. The Davis mill, which has been doing good work, is closed down for the present on account of a landslide. This mill is a Huotington plant of 10-ton capacity. The Hope mill, a five-stamp plant with two concentrators, has also closed down for the present. Fred Steen has a Huntington plant on his property, which he will put up in the spring. Mr. Steen has constructed over three miles of road from his property to Cornucopia, at an expense of \$2000. For several seasons past he has been working his ore by the arrastre process, but now that he has a mill, increased outputs may be looked for. John Carey has run in 100 feet on his Last Chance property, and from a six-inch vein has developed a six-foot vein. Mr. Beers has further developed the Parson mine by an additional 150 feet, and a large and well-defined ledge is exposed. The Union, the property of Ainsied & Co., has been worked all summer, and operations will be continued all winter. The company has worked a large amount of ore at the Hope mill, and a carload was shipped to Tacoma. The most satisfactory results were obtained. They will put in a milling plant next season. Carey and Pierce have developed a fine property in the Red Maiden, and a fine three-foot vein is in sight. They expect to go down on the property in the spring. This mine is situated just below the celebrated Simmons group. There will be at least three mills in operation in this district by the first of July.

NOTES.—Jacksonville Times, Dec. 11: Piping has commenced at Ennis & Cameron's mines in Galice creek district. The Sterling Mining Co. has an abundance of water and is taking advantage of it. Messrs. Bailey, who now own the Orme diggings in Foothills creek district, have commenced operations for the season. A. W. Sturgis is cleaning up the balance of the ground he stripped off last season. He has one of the best pieces of mining property in Oregon. J. T. Breeden and Mr. Anderson have struck very rich ore in their quartz ledge in Josephine county, and the prospects are first class for a permanent ledge. John Miller has rigged up his Farmer's Flat mines, and has good prospects for a profitable run. He has built a first-class flume and made a number of other improvements. An important discovery is reported from Sardine creek district. It is said that some newcomers have found a good-sized vein of rich ore, but we have not learned the particulars. Dr. Flanagan's Huntington mill is kept busy crushing ore from the Messenger ledge in Josephine county, and first-class results are promised. The doctor has done much for the mining interests of Southern Oregon, and is deserving of success. There is a fair supply of water already, and if the stormy weather continues awhile longer, an abundance is assured for some time. Miners are consequently elated, as the season promises to open considerably earlier than usual. The deal has been closed, we are informed, whereby the Patton ledge and its numerous extensions near Ashland pass into the hands of a Portland syndicate, who intend to develop the mines in the immediate future. The recent tests of the ore from these claims are satisfactory to the owners.

WASHINGTON.

CONCUNULLY.—Okanogan Outlook, Dec. 9: E. E. Gooding and T. C. Flynn have commenced work on a claim recently discovered on the north side of Peacock hill. Speculation is rife as to the meaning and probable result of the expert examinations of the First Thought mine. Evidently a deal of some sort is on the tapis. Mr. Luther Wagoner, a mining engineer of note from San Francisco, arrived on Wednesday's stage and is engaged in making an examination of the First Thought mine. John Judge, who has been working on his gold claims on Palmer mountain, for the past three months, has returned to Conconully for the winter. Harris and McLaughlin have built a cabin at the Rainbow and are making preparations to work on the claim all winter. Geo. Cooper and John Wentworth finished the assessment on the Standard and are now working on the Bondholder, a Palmer mountain gold claim. Mat Greenstate is working on the Georgie Moore, one of the most promising gold claims on Palmer mountain. The ledge is about 12 feet wide on the surface, but has not yet developed to any depth. Bob Hargrove and Billy Hunt are now at work in the tunnel on the diamond. They are in 130 feet on the ledge, which is over three feet wide. There is about 18 inches of good pay ore in the breast of the tunnel, and it is constantly improving.

MECHANICAL PROGRESS.

The Inventor of the "Bessemer Process."

The origin of what is now universally known as the "Bessemer process" of making steel has always been an honor divided between Sir Henry Bessemer of England and the well-known American iron-worker, Wm. Kelly. It is, however, quite generally believed by Americans that Mr. Kelly was really the original inventor, but through lack of means that he was unable to bring his discovery into general notice and use. Hence Sir Henry bore off the palm and profit. There is ample proof that before Sir Henry had ever commenced his experiments, Mr. Kelly had erected a little, old-fashioned, cheaply built furnace in Lyon Co., Ky., where he actually turned out steel on precisely the same principle afterward employed by Sir Henry in England. That old furnace is still in existence, but in a very dilapidated condition, and it is now proposed that it should be carefully taken down and with the original diminutive converter transferred to the Exposition grounds at Chicago, and there restored to its original condition, and placed among the exhibits at the Columbian Exposition.

If several photographs should be taken of the exterior and interior of the furnace, with its appointments as they now exist, and shown in connection with the restored work at Chicago, it would afford the most convincing proof of Mr. Kelly's priority of invention, and secure for this country, in the opinion of the thousands of visitors from Europe who will examine the exhibit, the just meed of credit which belongs to us. Mr. Kelly will have the credit of priority of invention, while to Sir Henry will be awarded the distinguished honor, to which he is entitled, of having made the same discovery at a later date and the further credit of having brought the invention into successful practice.

The Profits of the Bessemer Invention.

In this connection, it may be interesting to our readers to peruse the following remarkable statement of the profits of the steel process which bears his name, and which have been given to the world by Mr. Bessemer himself. He says: "Some idea may be formed of its importance as a manufacture when I state the simple fact that on the expiration of the 14 years' term of partnership of our Sheffield firm, the works, which had been greatly increased from time to time entirely out of revenue, were sold by private contract for exactly 24 times the amount of the whole subscribed capital of the firm, notwithstanding that we had divided in profits during the partnership a sum equal to 57 times the gross capital, so that by the mere commercial working of the process, apart from the patent, each of the five partners retired after 14 years from the Sheffield Works with 81 times the amount of his subscribed capital, or an average of nearly cent per cent every two months—a result probably unprecedented in the annals of commerce."

Furniture Manufacture in America.

The indications are that the time will soon arrive in this country, when it will not be the elegant thing to speak of a piece of furniture as being an imported article. American furniture designs are beginning to be recognized as the most really artistic of the period. Furniture made from American designs, may be a little heavy and may be more costly than that from French designs.

One of the prominent designers in New York, in a recent conversation with one of the editors of the New York Sun, pointed out two small inlaid tables standing together in his office, each equally artistic, but the one of American make more than double the cost of the importation. "The American table will last forever, the French one will break in three months, owing to the change in climate," he explained, "and yet we may tell this to one hundred customers and only the one exceptional buyer will pay the difference in cost. That is one of the difficulties under which the development of American art labors."

"Again, it is well known that we have no schools for study in this direction, for," continued the designer, in substance, "if we had the schools, who could be the professors and instructors in these schools of American art? Some one suggested that I should; but I am not capable of filling the place, and wouldn't accept it if I were competent. I have studied 18 years and don't know anything about it yet. The American designer has learned what he knows by hard knocks, not soft ones; by failures, not successes; by practical experiments, not theories; and he is not going to give the result of his life struggle for the stipend allowed to teachers of anything. He can only bid adieu to the world by giving those who follow him the results of his experience in his work."

"Just now the American style is, like the American people, cosmopolitan—its individuality has not crystallized, and yet it is unlike anything on the other side. There are so many and such diverse views upon the subject that no one is able to set himself up as leader. There are 50 men of authority in this branch of fine art. If one of the 50 announces his view as the right one, all the other 49 rise up and dispute him, and each of them is equally as

right as he, because we have as yet no established standard. Americans, in reality, are studying the best the world has known in all periods, and from them are evolving American art. But we are too young a people to have a definite idea of our peculiar style familiar to the world outside the profession. We must have years, not only to perfect our individuality, but to impress it upon the world and to elevate public taste into creating a demand for our best results, even at an advance in price. The American designer originates his idea, formulates a rough little outline of it, hands it over to his French and German draftsmen, who work it out with the patience and painstaking skill which the designer is in too much of a hurry to spend his precious time over. This design is executed, and when completed is sold to the connoisseur who appreciates the difference in the durability and beauty of the home product, and willingly pays the advanced price. "We shall no doubt, eventually be able to establish an American School of Design in this particular branch of industry, with marked characteristics by which it may be distinguished, and by which its authority will be acknowledged. Then will come the time when the American product will be at a premium because it is American."

STEAM VS. WATER FOR THE GRADUAL REDUCTION OF TEMPERATURE.—Water is a good lubricant when rightly applied; but hot steam is better than cold water for reducing the temperature of a hot journal or guide. A knowledge of this fact, says the *Railway Review*, and the wit to use it at the right moment recently helped an engineer out of a tight place. He had to take the superintendent up the road on his engine to an important meeting. The superintendent was in a hurry, and they started out at a pretty lively pace. Everything went smoothly for awhile, when the guides on the right-hand side began to smoke. The engineer shut off, got down and found that guide in first-class shape as a frying-pan, but its efficiency as a guide was seriously impaired. The superintendent got down, too, and said: "Put some water on her quick." "No, sir," was the answer; "if you put water on that guide now, you will twist it all out of shape." "What are you going to do?" said the superintendent; "we haven't much more time than to get there now." The engineer said nothing, but he took his wrench and eased off the nuts on the stuffing-box studs enough to allow the steam to blow through past the piston-rod. He reasoned that the steam blowing through on the hot guide and condensing would cool it just as effectually and much more gradually than eight or ten buckets of water dumped on at once, while the water would at the same time act as a lubricant. They got up and started ahead easy. The engineer watched that guide with some anxiety, for he was not sure of the result. At the end of ten miles he stopped, went down and felt it. With a calm smile and an "I told you so" expression, he pulled out the throttle, drove ahead, and brought the superintendent to his meeting in time.

A COMBINATION OF IRON AND OAK PAVEMENT.—At the November meeting of the American Society of Mechanical Engineers, a paper was read by Mr. I. W. Cole descriptive of a combination of iron and oak pavement, which consists of cast-iron pockets and bottom plates with oak blocks. The pockets are filled with green oak 3-7-16 inches square on the top and about 5 inches long. The blocks are driven into the iron pockets some 3 inches, and receive the traffic on the end of the grain of the wood. Each full-sized bottom plate has five pockets, four half-pockets and four quarter-pockets. Thus, at the joints of the bottom plates in some instances, two, three or even four bottom plates may support one of the hardwood blocks, dividing the strain and holding an even surface on the upper side of pavement. Each iron pocket has a small hole for draining away any moisture. This block pavement, said the writer, was put down May 30, 1890, with the newly sawed oak blocks projecting two inches. In August, 1890, it was inspected and found them hammered and worn to 1½ inch projection; and in September, 1891, another inspection showed them projecting about 1½ inch above the metal pockets. The traffic crossing it includes largely loads of roofing slate and of rough earth-stones, and loads of from 3 to 5 tons each are quite frequent.

NO MORE BURST PIPES.—Much annoyance and no little expense is often met with in freezing weather from the bursting of water pipes. An Englishman, however, has recently devised a way to avoid such trouble. It consists in attaching a cup-shaped air chamber to a piece of pipe, which can be coupled at both ends with the pipe to be protected. The air chamber is separated from the water flowing through the pipes by means of a rubber diaphragm. In case the water in the pipes freezes, the expansion of the water, instead of finding an outlet by bursting the pipe, simply forces the diaphragm to yield, thus compressing the air cushion within the cup. It is said that a pipe so protected will have entire immunity from bursting by frost.

AMERICAN SCREWS IN EUROPE.—It is said that the demand for American screws is so great in England and Germany that a screw company of Providence has established a branch factory in Leeds, England, and will soon put up another on the Continent.

SCIENTIFIC PROGRESS.

Science in the Mine and Shop.

There is a somewhat diversity of opinion among the masses in regard to the value of scientific knowledge in the mine—less so, however, in the shop. Some one has said that "If we took the greatest chemist in the world, he would not find much exercise for his chemical skill in the management of a coal mine. It would be like cutting blocks with a razor." To the above it has been replied that "It is quite true that if the greatest chemist in the world were placed in a coal mine, he would find very little scope for the exercise of his analytical dexterity, or for the application of those recondite scientific principles with which he is familiar. But it might be affirmed with equal truth that if the greatest mathematician in the world, the man most thoroughly conversant with the laws of dynamics, were charged with the management of a fitting shop, his mathematical formulae would be of very little use in the direction and management of the men under his authority. Neither great endowments nor lofty scientific knowledge are immediately available in the ordinary routine business of life, their value being manifested in the discovery of rules or the invention of processes which men of another stamp put to practical use."

Scientific knowledge in the ordinary superintendence of mine work, whether in coal, silver or gold, is of very little use, a great many people have been wrong in expending large sums of money, both in this country and in Europe in encouraging the establishment of mining and technical schools. True, it may be difficult in coal or gold mining, for instance, to say just where and when the scientific knowledge may come in. We are writing just now of the mine and not the mill or furnace.

In this line of thought, a gentleman of large experience wrote, some years since, as follows:

The Value of Scientific Knowledge

"Lies chiefly in the improvement of the man himself who possesses it, in the sharpening and strengthening of his faculties, in the formation of just habits of thought, and in the aptitude which it communicates of dealing with unforeseen circumstances as they arise. It does not teach him to do anything which men of practical experience only cannot do; but it teaches him to do many things in the right manner, and at the right time, which they might not think of doing at all. A man familiar with the ordinary phenomena of chemistry, and well instructed in the laws of that science, would be so much better qualified to deal with ventilation than if he knew nothing of the composition of the atmosphere, and this for the simple reason that he would more readily and keenly appreciate the importance of an abundant supply of fresh air. It is quite true he could do nothing extraordinary toward averting an outburst of gas, or neutralizing the disastrous effects of an explosion; but, in proportion as he understood the danger, he would be the more vigilant in adopting the necessary means for guarding against it. Coal-mines are infested with other gases besides carburetted hydrogen, and it is of great importance to the health of the workmen that they should be cleared away as fast as they are discharged."

The man of scientific knowledge, though possessed of no specific, nor master of any conjuring process for expelling them, is yet better qualified than an ignorant man for dealing with them, because he understands not only their nature when he encounters them, but also their injurious influence on the health and spirits of the workpeople.

A scientific knowledge of mechanics is useful to many classes of officials employed in connection with mines, not because it lets them into any secrets for doing work more economically or more expeditiously than ordinary workmen can do it, but because it opens their eyes so that they can see when work wants doing, and awakens their faculties to the right time and the right mode of doing it.

In an extensive and well-organized system of industry, whether in a cotton-mill, a mine, or elsewhere, the greater part of the people employed are restricted to one simple and monotonous duty, in the performance of which scientific knowledge can render them little assistance. Yet even in the superintendence of a machine, there is a difference between intelligence and stupidity, which is to the advantage of the former. In the case of officials invested with authority or intrusted with a discretionary power, a man with a little mental cultivation can discharge his duties much more to the satisfaction both of his employer and his fellow-workmen than will one whose faculties have never traveled beyond the limited sphere of his own observation.

In few departments of industry have there been of late years so many and such signal improvements as in that of mining, and all these improvements have been framed more or less closely in conformity with scientific principles. It is true that many of them have been introduced by shrewd practical men, with no guide but their own sagacity, assisted by experience; but it is equally true that such men have previously spent an infinity of labor to little purpose, which labor they might have spared themselves had they possessed a little scientific knowledge, and thereby become acquainted with what others had done before them.

Few of our readers will have much difficulty

in calling to mind cases where men have raised themselves to respectability and competency and opened out the means of livelihood to hundreds of people around them through their knowledge of science in general, as applied to the various industries, and to their knowledge of geology, in particular, as applied to the various departments of mining.

But why need further reference to this matter, which has been under consideration for the last 50 years or ever since the first Mechanical Institute was established, to collect and disseminate industrial knowledge among both employers and employed? The establishment of technical schools in Europe was the means by which that continent took and has kept the advance step in the industries up to the present time. It has been by means of those schools that the managers in her mines and in her shops have led the world of industry.

The best test of theory is to be found in results, and we believe that whether in mine, the shop, or the field, those countries and those districts where most is done for the promotion of education among the masses have become the most prosperous communities. It is there that the workmen get the highest wages and the employers universally realize proportionate profits. Of course these observations, like all others comparing the results of knowledge with those from ignorance, is based on the assumption that in all other important points the cases are equal. No superiority of knowledge or management will make a poor mine a rich one, but it will, in every case make a poor mine pay better than though it were worked under ignorant, or vicious management. Of course, no education will make a block-head as capable as a man naturally endowed with a quick apprehension and sound judgment. All we claim is that a man with length and breadth of experience, supplemented with a thorough scientific education, will make himself more useful in any calling, than a man with any amount of experience, but totally deficient in scientific knowledge.

PRINTING UPON METALLIC SURFACES has heretofore been a very difficult work, especially when it has to be done in colors. Hitherto, all impressions upon metal have been obtained by the transfer of a freshly printed sheet, or by the transfer of the impression upon a sheet of rubber to a sheet of metal. To this effect, it is necessary to construct special lithographic presses in order to obtain an exact adjustment of the colors forming the subject. In order that the printing may be done directly from a hard surface, that is, the lithographic stone, upon another hard surface, that is, the metal, it is necessary to be able to render the metallic surface elastic enough to take the ink that the stone carries, without impacting or destroying the details of the subject. In order to reach such a result, the process employed is as follows: Upon the metallic surface to be printed, there is produced by the mechanical action of very fine sand, a fine and close grain, which is diluted and cleaned by immersion in different alkaline solutions. This roughened and velvety surface takes a lithographic impression as well as paper and fabrics do. Immediately after the printing, the sheet of metal is submitted to a temperature of 50 degrees in a special stove, the object of which is to cause the ink to enter the pores. The impression is, therefore, no longer superficial, but is printed in the metal itself, whose expansion and contraction it may follow without undergoing any alteration. The metallochromic prints, covered with two coats of varnish, applied hot and fixed in a stove, present the same characters of durability as enamel and enamel.—*La Nature*.

A NEW USE FOR CORN.—American corn seems to be fast working its way into use in Germany. The failure of the European crops has recently given it quite a new impulse. But there is another use for that product which has been gradually being developed for several years, and which now promises to assume an important place in a German manufacture—that of soap. Hitherto manufacturers have used linseed oil, procured in Russia, but owing to the failure of the crop there, they were compelled to look in other directions for a supply of oil. East Indian linseed oil has been tried, but the experiment was unsuccessful. An eminent chemist, after many experiments, decided that the oil obtained from corn was the best suited for the uses of the manufacturers. The supplies for this purpose are now being obtained from Chicago, and the chances are that the trade will soon reach very large proportions—reach far up into millions of bushels annually.

THE INTENSE BRILLIANCY OF LIGHTNING.—One consequence of the short duration of lightning is an apparent diminution of its brilliancy. It has been proven that light cannot produce its full effect on the eye unless it remains at least as long as one-tenth of a second; but lightning lasts only the ten-thousandth part of a second, and it follows from this that what we see is one hundred thousand times less bright than it really is. When we recollect that even thus diminished, its brilliancy is such as to cause temporary blindness, if too closely watched, we may feel grateful that we cannot see it in its true vividness, for our human powers of vision would be too weak to bear such a sudden and overwhelming illumination.—*Gairland's Electricity*.

HOT WATER cannot be raised to any considerable height by suction.

ELECTRICITY.

Late Electrical Devices.

Among the late electrical devices may be mentioned a motor especially adapted for the use of students and for experimental purposes, intended to be operated by static charges, and which may be used with a different number of coils, or have the electricity thrown upon one side of the main disk only, is shown in perspective and vertical cross section in the accompanying illustration.

A new electric heater is attracting much attention among railroad men at the East just at this time. Many of the electric roads in this country and Canada have them upon their cars and express satisfaction with them in enthusiastic terms. The points which call forth the greatest comment are the neatness and economy of space, labor and the money which attend their use. Scorching of car ceilings is prevented. No room desired for other purposes is required by the heaters. Fewer men are required to produce the same results as are obtained from stoves; that is, less attention is required to secure the same efficiency. Formerly it required the attention of some one to obtain the proper coal for the stove and of some one to place the proper amount on each car. Now the fuel for heating is simply more of the same as that used for the power station engines used at the same place and this fact does away with all the care of separate stoves. The only necessary work is the tending to a single switch which at most would require not over three minutes a day, while the results are apparently all that could be desired—comfortably heated cars, and absolute immunity from fire in case of accidents, collisions or in any way.

A new electrical fire-extinguisher has been devised, which is operated by the fire itself, wherever it may start. A chemical generator of sufficient capacity is first provided, and from this, pipes are carried into each room in the building. Attached to the ceiling of the room is a jar, in which acid is restored, and inside of which a cartridge is placed. An open circuit battery is used. The thermostat in each room is set at any desired degree, say at 80 degrees. In case of fire the mercury rises to this figure, and the circuit is closed. This explodes the cartridge in the jar, a valve drops, and the chemicals are precipitated into the room through a series of sprinklers. There is also in connection with this device a system of dry pipes, and if it be found that the chemicals will not extinguish the fire, an officer on the outside of the building can determine by the annunciator in which room the fire is located, and by turning a switch can flood the room with water without going inside. This system can also be made automatic.

An improved phonograph, in which the ordinary wax cylinder is replaced by a continuous ribbon, is a most useful improvement, and will, no doubt, do much to secure for that instrument a more general introduction. On the ordinary cylinder now generally employed in phonographs, the greatest length of record, expressed in time, is considerably less than eight minutes. With a machine employing a recording ribbon an almost unlimited length of record could be made. A ribbon is not liable to be affected by variations in temperature, which tend to make the ordinary cylinder brittle and more or less inoperative and defective.

An automatic electric gas extinguisher is a late and useful device, which depends for its operation on the variations in the electrical conductivity of selenium when exposed to light. It will be employed for automatically extinguishing gas in stores where it has been allowed to burn all night. At the first gray streaks of dawn the selenium is acted upon, and the result is that the gas is turned off.

We learn from one of our exchanges—a technical paper of standing—that a friend, an inventor of some note, is working upon what he thinks will be a "big thing." His idea is the construction of a chemical plant which will generate and store at a small expense, enough electricity to maintain 25 or 30 lamps on a small system, say in one house. He has one that feeds half a dozen lights now. The chemicals used are new in the electrical field. He thinks he will get it in time so that a residence can be wired with a chemical battery and storage cells in the cellar which will have to be replenished only once a month.

Accidents From Electricity.

There is a senseless howl continually kept up, more especially by the daily press of the country, in regard to the great danger arising from the continually increasing use of electricity. Of course accidents will happen as long as people will be careless. In spite of all precautions taken by companies using electricity, their employees will get careless, and other people will be careless also. But this is a progressive age, and improvements must be allowed to be introduced, whether people are careless or not. True, now and then accidents occur, which are not the result of mere carelessness; but such accidents are probably less frequent in the use of electricity than in almost any other important line of progress. Steam, more than any other innovation during the past 50 years, has had its holocausts of burning, scalding, killing and mutilating human beings; but who ever thought of forbidding the use of that great modern agent of progress? We need not

mention the steam railroad, although, in proportion to the numbers, even in regard to miles, which it has transported, its destructiveness to human life and limb has been decidedly greater than has accrued thus far from electric roads.

A great outcry has been raised against what the daily papers have denominated the "deadly trolley wire," and yet the record in New York City shows that within a period of only 60 days, no less than 29 people were either killed or suffered serious injuries from horse cars in that city—a record which cannot be paralleled by the use of electricity anywhere. Even in this city a most acrimonious war is now being waged against the erection of poles for the trolley system on the Folsom and North Beach street railroad, and that even after a franchise has been granted for that purpose!

Safety Appliances.

The advent of electricity as applied to the solution of street transportation in large cities is proving a decided success over all other methods, whether horses, steam or cable. This is true, whether regard is had to economy in construction, in operation, or safety to passengers or pedestrians. Evidence in regard to each of these particulars has already become cumulative, and improvements are continually being introduced both in regard to economy and safety.

It is not only in street cars that safety appliances are being devised, but in every other department of electric engineering as well. One of the means of immunity from danger from wires lately introduced is a safety fuse, or "bug," as it is called by the electricians. This "bug" has been devised for application more particularly to electric light wires. It consists of a little oblong wooden block, carrying, by means of two brass screws, a bit of very soft wire. The current to each lamp goes through this bug, instead of passing over a continuous wire. Then, if there's trouble anywhere on the line, such as wires crossing, a short circuit or a "ground," the current, which is trebled at least, fuses the soft wire and the circuit is broken, the lamp goes out, and there is little danger of fire or personal injury. The extra current would otherwise break out through the weakest point, and might fuse the socket of the lamp and blow it all to pieces, or escape through a bad connection and start a fire.

Our readers are well posted as to what has been done in Frankfurt in the way of rendering wires safe for the conveyance of electricity on the largest scale; also what Edison is doing in the same direction in regard to the use of electricity for propelling railroad trains; also the claims put forth in an apparently authoritative manner by the Oregon electrician, Crouse, who places and crosses the positive and negative poles of an electric light wire in his mouth without harm. In short, we are just upon the fringe of what is yet to be done with electricity, both in regard to its use and safety.

The constructors of street cars for electrical propulsion and the companies operating them are keenly alive to the fact that it is to their interest to devise every possible safeguard for the comfort and protection of those who ride in their cars. Very few cars for either horses or cable are now being built at the East. One of the largest street-car builders in New York recently informed the editor of the *Street Railway News* that during the past year he had not built a dozen horse cars, but that the entire capacity of his factory had been confined to the construction of cars to be propelled by electricity.

General Improvements.

It is stated by one of our New York exchanges, as a very significant fact, that not only break-downs in the apparatus of electric railroads are less frequent than a year ago, but that accidents to life and limb are also diminishing. This result is due to two circumstances—greater experience and improved construction. The trolley system has recently been greatly improved and made more substantial and reliable. The motors have also been much improved, so much so that it would seem as if in that direction electrical engineers have well nigh reached perfection.

The fact that engineers, inventors and operators are at the present time giving such marked attention to every detail in the way of possible improvement in economy and safety, in the equipment and everything connected with electrical progress, is a most healthy sign that all occasion for complaint will soon be done away with in regard to the general introduction of this new agent of civilization and industry. First-class work and first-class intelligence, with a little patience on the part of the public, will soon remove all objections to this latest, best, and, in the near future, cheapest servant which nature or invention has ever vouchsafed to the human family.

PELTON WHEELS AND ELECTRIC MOTORS.—R. S. Hunton, one of the leading mine-owners of Colorado, says that electricity opens up a new era for mine development in Colorado, as well as in other localities. Many mines in the higher altitudes, of great promise, have been almost valueless on account of exporting fuel to them. Now, with Pelton wheels and electric motors, mines in the most inaccessible localities can be reached and operated at less expense than those most favorably located as regards fuel supply. The several plants of this character now running at Aspen, Ouray, Telluride, and other places, have demonstrated beyond all question the practicability and economy of this system.

GOOD HEALTH.

The Leucanthemum Correspondence.

Somebody has said that an observant, thoughtful man can learn as much from the mistakes of his fellow-men as from their wisest and most successful actions.

When Mr. Geo. F. Waters told the readers of the *Press* that leucanthemum taken into the stomach would correct its sourness, he no doubt believed he was right, but the note of your correspondent M. L. H. shows that he was mistaken by its simply saying that chewing a bit of soft pine would have had the same effect. As explained, it was the creating and swallowing of saliva, an alkaline secretion, which did away with the acidity of the stomach, and a sliver was just as good as an oxeeye daisy for that purpose.

Mr. Waters, it must be admitted, "came over us" just a little by using a long, jaw-twisting word to describe the beneficent plant which, under his discovery, was to become a great blessing not only to human beings but to cattle troubled with fullness of the digestive organs. If he had used the common name of the plant, the glamour of learning which gave prominence to his utterances would have been absent and few letters would have been addressed to him.

I must not be hard, however, on Mr. Waters, for without really intending it, he has shown that truth may be evolved from error when mind acts upon mind through the blessing of printer's ink. The important result of the correspondence is this: That if we are to eat in a way to get the highest possible nutriment from our food, we must chew it so well while we are at table that recourse to pine slivers and oxeeye daisies afterward to create saliva will be wholly unnecessary.

Considering the fact that man's strength, wisdom, success in business, family happiness and general usefulness in his day and generation depend, to a very large extent, on the complete assimilation of his diet, we can understand that eating is one of the most important, yes, one of the most serious matters, of daily human duty. The man who eats as if he were trying to get rid of a disagreeable undertaking displays neither wisdom nor refinement in his pell-mell gorging habits. Why should he by pure thoughtlessness, by hurry, or by absolute ignorance, be the enemy of his own body and the scourge of his family by his eating like a fool and not as a considerate being capable of assigning effects to causes—Indigestion to careless eating as one of them, for instance. If Thos. Carlyle, "the shaggy old lion," had studied how to eat before he studied multitudinous tomes of learning, he would have been a still greater thinker and writer than he was—in spite of himself—and poor, fretting, neglected Jeanie Walsh would have found him a better husband than his rebellious stomach would suffer him to be. "Know thyself" is a sage's counsel, but "know thy stomach," do not give it overwork; think what thou art doing when thou art eating; consider the fact that thy blood is thy life, and that it is at the table where that blood, and therefore thy life, is to be rightly or wrongly supplied, are words of counsel to which thinking men ought to give heed. It is of more importance to the individual man that he should be able to diet himself, so that he may and his earthly days like a fully ripened ear of grain, than that he should have the power to weigh the stars in their courses or measure the orbits of the comets coming within his ken. A giant mind trammelled with an indigesting stomach can never fully display its powers.

But not to encrease much further on your space, I wish to give a few hints to those who, after meal hours, find that there is rebellion being organized in their stomachs, and something must be done to check it, consisting neither of oxeeye daisy nor bite of wood taken into the mouth.

Here they are: Get hot water. To make it palatable, if that is necessary, put sugar or orange jelly into it; take a small slice of dry, light bread, chew it very slowly and thoroughly so that it may carry down as much saliva as possible to destroy the rebels. Then drink two good cups of this hot water, for by means of it as a conveyor, the saliva will reach every point where it is required.

If there is a painful fullness experienced, lie down on the left side for a short time and relief is sure to come.

If, however, a human stomach has for years and years been abused by the dumping into it of half-rotten food, with never a screen to hold back the coarse pieces, it will be no easy matter to make it a thoroughly effective servant of its owner. It is at meal-time that the preventive for indigestion can be best applied.

It is a sad thing to see a man whose love of table luxuries drives him to the digging of his grave with his teeth. It is sad, too, to learn of men, women and children dying because they are unable to give their teeth legitimate activity.

When we see intelligent people bring dyspeptic misery upon themselves through sheer thoughtlessness as to the extent to which their teeth ought to be used, one feels that here is the widest field of all for active commiseration. Mothers, if you are ambitious to have your children distinguish themselves in life by noble actions, see to it that as far as circumstances will permit, they may have well-informed minds

in carefully nourished bodies. Teach them how to eat; when to avoid drinking; and impress upon their minds the advantages of open-air exercises. If added to these bestowals, you teach them how to find the narrow way from earth to heaven, you will have conferred blessings which shall "drop like the rain and distill as the dew" long after you have passed away.

JOHN DARE EMERLEY.

USEFUL INFORMATION.

A PRACTICAL INDUSTRIAL SCHOOL.—Comparatively few people are aware that Chicago has a building almost wholly built by the students of an industrial school. The new building of the Institute of Technology, 147 Throop street, is the first building west of New York City ever put up wholly or in part by students. No better evidence of the practical character of the instruction of a school could be desired. The teaching of trades is in accordance with the broad plan of this institute which proposes to teach "Any person, any study, day and evening." It has classes in electricity, plumbing, bricklaying, as well as architecture and engineering. Dranghting of all kinds is made a specialty. A desirable opportunity is thus offered young men who desire to learn a trade, in a country where trade unions are keeping American boys from the shops to make room for adult foreigners who come to this country to "earn a living" by means of trades learned abroad. There should be hundreds of such schools where there are now but dozens, and there soon will be. The American people will see to it that ample opportunity shall in some way be afforded for "our boys" to learn trades by which they may be able to earn an honorable living.

UNWISE LEGISLATION.—A contemporary says that this is an age of novel legislation. In Indianapolis a school of thinkers, or political economists, are seriously advocating a law levying a special tax on wagons, because the wagons wear out the roads and create the expense of maintaining the streets. It is said such a law is in actual operation somewhere in Europe. The theory is that the man who does not own a vehicle does not wear out the roadway and should not be asked to keep it up. It sounds plausible and equitable to some people. The same reasoning would place the expense of maintaining the sidewalk on the persons who do not own vehicles. Applied to the public schools, the principle would heap all the expenses of school maintenance on married men having children, and the bachelors would go free. Bachelors and Benedicts all receive some benefit from public education. Everybody finds the streets, roadways and sidewalks useful. No wise law-maker undertakes to adjust all the inequalities of taxation. A man who is the happy possessor of a dozen children, in a mathematical sense, receives twelve times as much benefit from the public schools as the man who is not blessed with any progeny. Public conveniences are furnished as nature furnishes air. We use what we need.

HOW TO CLEAN LOCOMOTIVE FLUES.—Various devices are used for cleaning out the flues of locomotive boilers; but as a general thing, the devices employed are very unsatisfactory in their operation. Some time since, an Oakland engineer, Henry Orth, happened to be standing by a roundhouse fireman as he was busily engaged in cleaning the flues of a locomotive with what was then considered the best instrument in use for such work. Orth carelessly remarked that he thought he could improve on the rod and worm which the fireman was using. "How will you do it?" was the reply. Without any further remark he started off to the shop in a thoughtful mood, and soon returned with a long iron pipe near one end of which he had drilled several holes, and attached an air hose to the opposite end. Then he ran a locomotive up beside the one to be cleaned, and attached the air hose to the hose on the live engine. The pipe was inserted in the flue, and when the air was forced in, it scoured out the flue like sand and paper. Since then Orth's patent has been generally used, and it has always given satisfaction.

ROPES FOR MINING PURPOSES.—From a report recently made to the French Government, it appears that hemp or aloes ropes are almost exclusively used for all depths of shaft in Belgium. The makers guarantee the ropes to last one and a half to two and a half years, and should they fail earlier, a twelfth to a twenty-fourth of their cost is deducted for every month short of their stipulated duration. Steel wire ropes when used for mining purposes, should be of crucible steel having a breaking strength of 70 to 76 tons per square inch. Large pulleys are more necessary for wire than for hemp ropes, the smallest diameter permissible being 1,300 to 1,400 times the diameter of the wire in the rope, if of iron, and 2,000 times if of steel. Wire ropes are best made with a hemp core, being more flexible.

CHEAPENING MACHINERY.—A few years ago a pumping engine for town or city water supply was a rather formidable, as well as a costly piece of machinery—something no moderately small town could ever hope to own and operate. Pumping engines were luxuries for large cities. Now, engines are made for such purposes, so moderate in cost, and so easily erected and managed, that any ambitious town of a few thousand inhabitants cannot afford to be without good water.

TABLE OF CONTENTS.

EDITORIALS.—Coal-Preparing Machinery, 395. Passing Events; The Patent Office Business; A Point from Mr. Mackay's Testimony; Fumes from Roasting Ore; The Practical Catechism; Miners' Meetings; For Engineers and Firemen, 402. Mannesmann Tube-Rolling, 403. The Comstock Milling Case; The California States, 405.

ILLUSTRATIONS.—Coal-Preparing Machinery, 395. Mannesmann's Tube-Rolling Illustrated, 403. **MISCELLANEOUS.**—The Dead Blue River Channel; Vertical Mining Shafts; Railroad and Land Grants; The Woodbury Concentrator; Amador's Gold Product; Mr. Mackay on Comstock Milling, 396. The President's Message; A Nevada Enterprise; Along the Columbia; Mines in the Desert; Kres Coinage Bill; Marble and Riolite; The Bradford Mine Sold; New Incorporations, 397.

MECHANICAL PROGRESS.—The Inventor of the "Bessemer Process"; Furniture Manufacture in America; Steam vs. Water for the Gradual Reduction of Temperature; A Combination of Iron and Oak Pavement; No More Burst Pipes; American Screws in Europe, 400.

SCIENTIFIC PROGRESS.—Science in the Mine and Shop; Printing Upon Metallic Surfaces; A New Use for Gerni; The Intense Brilliance of Lightning, 400.

ELECTRICITY.—Late Electrical Devices; Accidents from Electricity; Pelton Wheels and Electric Motors, 401.

GOOD HEALTH.—The Leucanthemum Correspondence, 401.

USEFUL INFORMATION.—A Practical Industrial School; Unwise Legislation; How to Clean Locomotive Flues; Ropes for Mining Purposes; Chapsing Machinery, 401.

MINING SUMMARY.—From the Various Counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 398-399.

MINING STOCK MARKET.—Sales in the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 403.

MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke, etc., 406.

Passing Events.

The miners in different mining counties of the State are holding meetings and appointing delegates to attend the Miners' Convention, which is to meet in this city on January 20. The necessity of a permanent organization of miners is now generally recognized, and their interests will be better cared for than when left to individual effort, as has been the case in the past.

The fact that the supply of paying ore in the New Almaden quicksilver mine has about given out, and that many miners have been discharged will doubtless lead to more vigorous development and prospecting of other quicksilver claims in California. Already some of those persons interested in the New Almaden have purchased the Bradford quicksilver mine, Lake county, and will make a big mine of it. Other mines will also be opened in other counties.

An English company having bought the Quartz Valley hydraulic claims in Siskiyou county will operate them to the fullest extent during the coming season. This is one of the good effects of legally declaring the Klamath river a nonnavigable stream, for here will be no trouble about the debris.

The next number of the PRESS will not reach

our readers until after Christmas Day, so it becomes us to express good wishes now. To all our friends, both distant and near at hand, we extend the compliments of the season and a wish that to them all may come a "Merry Christmas."

The Patent Office Business.

The annual report of the Secretary of the Interior, just published is for the fiscal year ending June 30th last. In this, a summary is given of the work in the U. S. Patent Office. It appears that, including applications for patents for inventions, for designs, releases, for the registration of trade-marks and labels, and for caveats, the total number of applications received was 45,949; number of patents granted, 25,307; trade-marks and labels registered, 2,033; patents withheld for non-payment of fee, 3,514; patents expired, 12,383. The total receipts were \$1,302,749.39, and the expenditures \$1,145,502.90, leaving a surplus of \$157,291.69 to be turned into the Treasury, and increasing to \$3,947,847.97, the amount in the Treasury to the credit of the patent fund.

From the statement published it is seen that the unusually large number of applications for patents during the year ending June 30th 1890, was very nearly equaled by the number issued during the past year. In these two years nearly 10,000 cases have been presented beyond the average of 1888 and 1889.

Many persons suppose that, in view of the great number of patents already issued, there is a falling off in number of applications. But the contrary is the case. Patented inventions are increasing. In fact, even with increased force the Patent Office has hard work in "keeping even" and more examiners are needed to meet the increase in the volume of business.

While, as stated, the number of applications for patents is increasing, notwithstanding the great number of patents already issued, it is no longer such a very easy matter to get an application properly through the office. So many "references" are made to previous inventions in these days that a knowledge of the state of the particular art is absolutely necessary to obtain a patent of any value, and get it within reasonable time. Only experienced patent agents should be employed to draw the specifications and attend to the case while in the office. Otherwise the inventor is liable to vexatious delay, and if he gets a patent, it is not apt to stand the test of the courts. The multiplicity of patents necessitates the most careful work in the preparation of papers for new ones. The description must be unmistakably clear and the claims so drawn as not to interfere with those of patents already issued. It is only people of long experience who can do this work, and inventors are foolish who entrust such important business to firms with no reputation to maintain, or men who have never had more than a dozen or two cases.

SILVER IN THE SOUTHWEST.—A dispatch from El Paso, Texas, dated Dec. 15th, says: The Southwest Silver Convention was called to order by Chairman Longmear of the Bullion. About 500 miners were present and fully 600 are delayed by storm-bound trains. The address of welcome made by Juan S. Hart of the El Paso Times was responded to by Governor Prince of New Mexico. Ex-Senator John H. Reagan made an able appeal for free coinage, handling the financial questions of the country in an exhaustive manner. William Burne, Speaker of the New Mexico House of Representatives, was made temporary chairman. Later the convention adjourned to witness a bull-fight in Juarez. It will reconvene in the morning.

STRIKE IN GAS.—There is considerable excitement in Salt Lake because of the strike of natural gas, with a pressure of 145 pounds to the square inch, in the six-inch well at Lake Shore Station, 12 miles north of this city. The well reached the Trenton rock at a depth of 550 feet, and the gas rushed up under the suddenly increased pressure with a roar that was heard for a long distance; but the well leaked, and the gas, seeping up through the ground, caught fire at 10 A. M. The Manager of the Gas Company, Mr. Schmidt of Kansas City, and an assistant, were caught in the flames and barely escaped cremation. The fire burned the neighboring buildings.

A Point from Mr. Mackay's Testimony.

When Mr. John W. Mackay was testifying in the Hale and Norcross suit, he was asked "If the custom of the mills claiming the tailings did not grow out of the old contracts," to which he answered: "Yes. In those days the mines holed and assayed their ore, and sold them to the mill for 65 per cent of the mine assay value. When the mill had accounted for the 65 per cent mine assay, then all the balance belonged to the mill, but there was no charge for milling." Then Mr. Mackay was asked if ore which assayed at the mine \$72 per ton was not very badly worked if it returned only \$40 per ton. In reply, he said: "Yes; because they should account for 65 per cent of the mine assay at the very least."

According to one of the hooks put in evidence in the suit now pending, it was shown that the mills returned less than 52 per cent of the mine assay of the Hale and Norcross ore taken out and milled in the years 1888, '89 and '90, and, in addition, charged \$7 per ton for milling, besides keeping the tailings. The mill charges, too, were made in the face of the well-established fact that ore can be milled now for much less than it could have been ten years ago. There are responsible millmen who will give bonds, too, for its faithful carrying out, who would be glad to get a contract to mill the Hale and Norcross ore and pay the company 70 per cent of the mine assay value and make no charges for milling."

Fumes from Roasting Ore.

The people of Butte, Montana, are having lots of trouble with the fumes from the ore-roasting heaps of the Boston and Montana smelters. The fumes of sulphur are almost unendurable. The roasting of ores in heaps is in violation of a city ordinance. The Butte and Montana, after a suspension of three weeks, during which interval the city was rid of the fumes, announced that they would test the validity of the ordinance. Accordingly heap roasting was resumed at Meaderville by this company.

The action aroused great indignation, and it required the counsel of the most conservative citizens to avoid mob violence. At a mass meeting of prominent citizens held in front of the City Hall, the Mayor's action in sending a large force of men to Meaderville, to cover up the burning ore heaps with sand and smother them, was unanimously indorsed. Two hundred men, drawing pay from the city at \$3 per day, were put to work, and more will be added if necessary.

One of the resolutions adopted by the Citizens' Committee reads as follows:

Resolved, That it is the sense of the people of the city of Butte and vicinity, expressed by the proper committee having the matter in charge, that the Boston and Montana Copper Company in again setting fire to the heaps, in utter disregard of the laws, is guilty of one of the greatest and most atrocious crimes ever committed in a civilized country; that we believe a number of deaths have already been hastened in the five days their heaps have been burning; that a fatal epidemic will be precipitated if they are allowed to continue their inhuman and monstrous course; that self-preservation is the first law of nature, and that the people of Butte will not permit said corporation or any other to longer stand in its way of the full enjoyment of its rights and liberties, and that this death plague must be stopped at all hazards."

The Practical Catechism.

This is the title of a neat little work by Robert Grimshaw, which is a collection of questions on technical subjects, by manufacturers and others, and the answers thereto, published by John Wiley & Sons, and for sale by Osborn & Alexander of this city. The price is \$1.25. The questions answered emanate from manufacturers, owners, railway men and those of a hundred diverse occupations. Some have been answered in periodicals and others in legal contests. Out of the great mass of material at hand in his note-books, the author has selected those which he thought would most interest the largest number of practical men; and it is to this class of readers that the volume is addressed and commended. Most of the examples are drawn from actual practice. There is an unusually extended alphabetical index. The book is arranged by question and answer, and the language clear, plain and concise, as is the case with all this author's works. The book is really a very useful one and exceedingly handy for reference, the "catechism" embracing such a wide range.

Miners' Meetings.

In view of the coming Miners' Convention in this city (January 20th), several miners' meetings have already been called, in order to select delegates. Others will follow. Each county in the State is entitled to 30 delegates, except San Francisco, which is to have 60. A meeting of mining men will be held at the Mining Bureau at 3 P. M. next Tuesday, to take action toward selecting delegates for this county.

In Nevada county this week, some 300 representative hydraulic, drift and quartz miners assembled and organized the County Miners' Association, with Alf Tregidgo, superintendent of the Peabody and Washington quartz mines, as president. Thirty delegates were elected to attend the State Miners' Association at San Francisco, January 20th. There was an utter absence of rancor and demagogism in the proceedings, which were marked with earnest enthusiasm.

The resolutions adopted declare that gold and silver are requisite as a basis of credit, and emphasize the faith shown by Government engineers that there are over \$300,000,000 worth of gold in gravel channels that can be mined with safety to rivers and farmers by the outlay of \$1,500,000.

They recommend that Congress provide for constructing dams, and that engineers certify as to their efficiency before using. They suggest the alteration of the mining laws so as to simplify proceedings for Government patents and abolish the presumption that mining claims will not pay, until proof has been made of their value.

These are practically the same suggestions that will be made by all the miners, and the same as those stated in the address issued by the Placer county miners, published in the PRESS, last week.

For Engineers and Firemen.

"Edwards' Examination Questions and Answers for Engineers and Firemen," is a little book, but a very useful one for stationary and marine engineers and firemen who desire to obtain a U. S. Government or State license.

This work is by an old and distinguished author (Emory Edwards), who enjoys considerable celebrity in treatment of industrial topics and engineering industries. This very complete book elucidates quite distinctly some of the most important operations in engineering practice, exhibits in a graphic manner the plans to be adopted and measures necessary in cases of emergency, and explains in a manner quite easily comprehended, the duties to be performed by all who are connected with steam engines and points out the easiest manner of accomplishing them. Here is a work comprising information on the most important questions and duties in connection with the application and management of steam engines of every form and style constituting an invaluable guide in all technical occupations and an essential companion for the engineer and fireman.

Principles and practice are clearly exhibited, and engines and boilers, with their appurtenances and auxiliary appliances, are fully discussed. H. C. Baird of Philadelphia is publisher, and the agents in this city are Osborn & Alexander. The book only costs \$1.50. It was not gotten up for the use of experts or educated engineers, but on the contrary, for the great number of worthy men who run steam engines, and who though of limited education, desire to advance themselves; such men deserve to be encouraged. To possess the U. S. or State certificate of competency (license) is the goal of many an ambition, and this book is intended as a means to that end. It is of convenient form for ready reference and may be carried in the pocket.

SAN BENITO COAL MINES.—George B. Tolman, superintendent of large and newly discovered coal mines in the Coast Range of San Benito county, 23 miles from Firebaugh, on the Southern Pacific, is in the city. Specimens of the coal which he brought up have been tested by Prof. Hanks and reported good. The mine is in a canyon in the higher foothills of the range. A railroad is to be built to Firebaugh to connect with the Southern Pacific, so the coal can be got out.

ASSAY OFFICE.—Senator Dolph has introduced a bill for the establishment of an assay office at Portland, Or., to cost \$100,000; also, a bill for one at Baker City, Or.

DIAGRAMS SHOWING ACTION OF PARALLEL ROLLS.

Mannesmann Tube-Rolling.

With good reason may the invention of the Brothers Mannesmann, in the manufacture of pipes, be regarded as an important improvement. For pipes destined to meet severe requirements of resistance to interior pressure, it is indeed calculated to revolutionize previous practice. The method has been described by Dr. Herman Wedding before the American Institute of Mining Engineers.

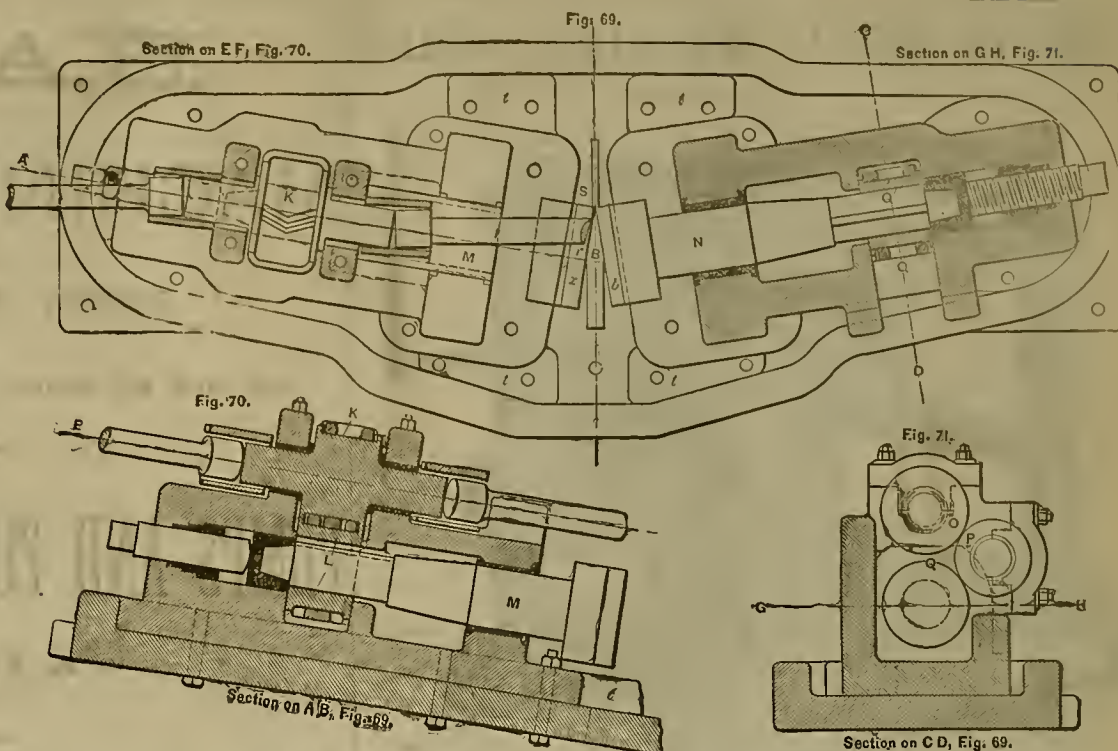

The process consists in feeding a solid, highly-heated round bar of ingot metal between rolls which, while their axes are oblique to the axis of revolution, revolve both in the same direction. The metal of the surface of the bar thus acquires an increased motion in a spiral direction, and is drawn over its core, receiving consequently the form of a pipe. It is, indeed, not practicable, without an excessive expenditure of power, to make the interior diameter of such a pipe very large. But it is sufficient that an exterior space is created, for there is no difficulty in widening it over a mandril by further operations between rolls in the form of conical disks, revolving in opposite directions. Since, in this operation also, the pipe moves spirally forward and all the parts are spirally pushed and pressed, the metal becomes still denser. It is this spiral arrangement of material which makes the Mannesmann pipes so remarkable, quite apart from the advantage they possess in presenting no lines of welding whatever. Moreover, blow-holes (which are invariably present in ingot iron) are so squeezed out spirally as to make the walls of the pipe completely impermeable. A proof of this is the retention of hydrogen for weeks in a piece of Mannesmann pipe, closed at both ends. Pipes thus made and enlarged have been successfully produced of all diameters up to 300 mm.

The Mannesmann rolls have to be driven at a speed of 300 revolutions and upward, and their relative positions to each other and to the

driving-shaft must be made adjustable, with nicest precision through a wide angle. These severe requirements in coupling the rolls to the driving-shaft were met by a special design indicated in Fig. 56. Two shafts, *a* and *b*, are each provided, at points equally distant from the center *S*, with two arms that form equal angles with *aS* and *bS*, and constitute couples which will remain in constant contact. The touching points *e*₁ and *e*₂ slide toward and away from the center *S*, each describing an ellipse during a complete revolution. In practice this movement is accomplished by setting a bronze semi-cylinder *a'* into a rounded groove on each driving-arm and making it bear with its flat surface upon a similar semi-cylinder *b'*, which is fitted into the corresponding driven-arm. The device is ingenious and works well.

Another serious obstacle which had to be overcome by special design lay in the excessive unit-stresses in the teeth of common gearing, when transmitting very high powers at high rates of speed. The form of the new Mannesmann gearing is indicated in Fig. 57. [The figures bear the same numbers as in Dr. Wedding's paper.—EDS. PRESS.] The teeth or pins are shown at *a'* *b'*; they are so shaped that one seizes the other like a fork. It is evident that when both wheels have the same number of teeth, and when their axes are parallel to each other, the forks and the blades must meet accurately, provided the teeth be always kept in a parallel position. In both wheels, this parallelism of the teeth throughout their movement is maintained by special appliances not shown. But the position of the axes of the two wheels may be swung at any angle, provided the line *AA*, Fig. 57, remains vertical. In that manner a right-angle transmission, sketched at the right side of Fig. 57, may be obtained, and a large contact surface still be preserved for the transmission of pressure.

A further necessity for this process was the required storage of power, for which the fly-wheel of ordinary construction was not suffi-

LATEST ARRANGEMENT OF MANNESMANN TUBE-ROLLING MILL.

DIAGRAMS ILLUSTRATING MANNESMANN'S PROCESS FOR ROLLING TUBES.

cient. This object was attained by making fly-wheels with a rim of wire to run very rapidly. The formation of pipes by the Mannesmann rolls is indicated by the diagrams, Figs. 58 to 63. Figs. 58 and 59 show the ordinary rolling process with parallel roll axes and opposite directions of revolutions; Fig. 60 and 61, the same, when the rolls revolve in the same direction. In Figs. 62 and 63 is shown the effect of

obliquely set rolls, operating by simple friction. In Figs. 64 and 65, the formation of pipes, under similar circumstances, but with the added effect of pressure, i. e., the squeezing forward of the several particles of metal. Figs. 66 to 68 illustrate the enlargement over a mandril by means of conical obliquely set rolls. Figs. 69, 70 and 71 show the latest arrangement in actual practice.

The Comstock Milling Case.

The suit of M. W. Fox against the Hale & Norcross directors and others, whom he charges with the illegal appropriation of over \$2,000,000 of bullion belonging to the stockholders of the company, came up again on Monday, Dec. 14th, before Judge Hebbard.

At the opening of the morning session of the court, Judge Hebbard allowed the substitution of the names of W. S. Hobart, Alvinza Hayward, John P. Jones, the Nevada Mill and Mining Co. and Francis G. Newlands, executor of the estate of William Sharon, in lieu of John Doe, Richard Roe et al., charged in the complaint as conspirators with the Hale & Norcross directors to defraud the stockholders.

As Judge Hebbard was about to make his ruling, Mr. Mesick interrupted with a suggestion. He said that in case the parties were joined, and the real names substituted for the fictitious ones, it would be a miscarriage of all that had been done up to date. Judge Hebbard replied that under Sections 473 and 474 of the Code of Civil Procedure, he had no discretion in the matter. "But in no way," he added, "does it effect the defendants already joined in this action." Mr. Wood excepted to the ruling of the court and asked to have the case go over until all the parties were made defendants.

There was a long argument between counsels relative to the matter, and Judge Hebbard brought it to a close by taking the matter under advisement until the next day. Counsel were requested to submit authorities in support of the positions taken by them as early as possible.

The next day (Tuesday) the argument on the question whether or not to allow the case to proceed before the new defendants were served with summons, was renewed. Mr. Baggett contended that the presence of the new defendants was not necessary, as before a decree was rendered their rights could be protected with a day in court. Mr. Mesick insisted that all the issues should be tried at the same time, and as against all the defendants.

Judge Hebbard said there was one general principle of equity that a case ought not to be tried piecemeal. Among other things, the action was one for an accounting. The new defendants were certainly entitled to make cross-interrogation of any new evidence which might be given, and a continuance could not injure the plaintiff. He offered the plaintiff an opportunity to withdraw the motion to include those persons not served—Messrs. Newlands and Jones.

Mr. Baggett, while recognizing inability to summon either of those gentlemen, declined to withdraw his motion, whereupon Mr. Mesick announced that he appeared for Mr. Hayward and the Nevada Mill Company, and it was also announced that Gahner, Boalt & Bishop would appear for Mr. Hobart, thus making ten attorneys to the litigation.

Judge Hebbard announced that if service was not made by Monday next upon the new defendants, he would dismiss as to them in order not to delay the case, and ordered the matter continued until Tuesday, Dec. 22d.

The California Slates.

At the last meeting of the California Academy of Sciences, Melville Attwood, Esq., exhibited some specimens of slate from the Chili Bar slate quarry, El Dorado Co., Cal. One of these specimens was to illustrate the perfect cleavage. It consisted of a number of thin sheets, split from a single block, and arranged to spread apart like a pack of cards. That, intended to show flexibility consisted of two long thin sheets, joined at the ends, which would bend and spring as if made of metal. The piece illustrating toughness was a handsome large sheet in which a handsome open-work pattern had been cut. This slate, having these characteristics, is as good as any in the world.

Mr. Attwood made a microscopic examination of these slates. The specimens examined were taken from where the cleavage in the slate was well developed, and also selected from where it was at right angles, or nearly so, to the planes of stratification. The prepared sections were cut at right angles to the cleavage, and also on the planes of cleavage. The result of the examination proved that the California slates corresponded in all essential particulars with the fine-grained slates of North Wales, containing a very large proportion of mica, not like that in stratified rocks, but in minute flakes. Their average size might be taken at 1-1000 of an inch broad and 1-2000 of an inch thick, invisible to the unaided eye, but giving a silky luster to the rock. It is possible that more modern deposits may have the same structure, but Mr. Attwood has not heard of any in Great Britain more recent than those in the Devonian rocks.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING DEC. 8, 1891.

- 464,856.—FRISKET FOR HAND PRESSES—L. D. Clark, Fort Jones, Cal.
464,631.—PRUNE SQUEEZING MACHINE—L. Cunningham, Saratoga, Cal.
464,699.—RAILWAY RAIL JOINT—A. G. Edmondson, San Buenaventura, Cal.
464,603.—CUTTING APPARATUS—Hampton & Haner, John Day, Or.
464,941.—STATION INDICATOR—John Kueffer, S. F.
464,826.—OVERALLS—Isaac Kuhn, San Diego, Cal.
464,701.—PLANE ATTACHMENT—G. H. Melendy, S. F.
464,892.—TYPE-WRITING MACHINE—J. M. Prentice, S. F.
464,893.—HOSE COUPLING—Reid & Browne, Santa Ana, Cal.
464,716.—APPARATUS FOR DISCHARGING WATER—M. H. Robinson, San Diego, Cal.
464,703.—AUTOMATIC VENT FOR CASKS—Louis Stuhrt, S. F.
464,915.—DICE-BOX—Slinn & Holland, S. F.
464,698.—VENTILATING ROOMS, ETC.—W. Tarp, S. F.
464,905.—DRESSING FOR CARRIAGE TOPS—W. H. Townsin, San Jose, Cal.
464,642.—DISINTEGRATING FURNACE—Frank Walker, Los Angeles, Cal.

The following brief list by telegraph, for Dec. 15, will appear more complete on receipt of mail advices:

John T. Wahel, San Francisco, car coupling; Delbert E. Barton, San Francisco, draft for equalizing cultivator and shoe for cultivators; Conran I. Hall, San Francisco, valve; Charles Moore, Visalia, moor; William A. Russell, Los Angeles, lawn or orchard irrigator; Theophilus Tucker, Oakland, ornamenting walls or ceiling; William J. Wehner, San Francisco, horse-collar stuffing machine; J. S. Blood, Napa, Cal., washing machine.

NOR.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

INSTRUMENT FOR TAKING NAUTICAL OBSERVATIONS.—W. H. Beehler, Baltimore, Maryland. No. 464,261. Dated Dec. 1, 1891. This invention relates to an instrument for taking nautical observations, finding latitude and longitude, time, etc., either at sea or from a fixed point of observation on land. It is called a solarometer, and consists of a stand supported upon a constant level base, formed by a float within a bowl of mercury. The stand supports a horizon ring, which is thus always maintained in a level position, so that the visibility of the sea horizon is not essential. In conjunction with this is a globe having upon its surface a graphical representation of the fixed stars and different constellations. Exterior to this are equatorial declination, and azimuth rings with graduations and adjusting verniers and a zenith circle, all concentric with the globe. Upon the zenith circle are mounted object and observation tubes at an angle with each other for convenience, and an intermediate reflecting mirror by which the image of the object seen through the first tube is reflected through the second one. Azimuth tables are constructed for the principal heavenly bodies, and when an observation is to be taken, the azimuth arc is turned so that the body to be observed is seen in the tube. Various adjustments are then made to bring it to the exact center, and the exact instant is noted by a chronometer or watch rated to Greenwich apparent time. The difference between this and the local hour angle is read off on the equatorial ring between the meridian and the declination rings, and will give the longitude. The Nautical Almanac gives the lunar distance of heavenly bodies, and by comparing the lunar distance observed with that of the almanac, the exact Greenwich time is obtained at the instant of observation. An additional declination and azimuth ring are employed for this purpose. The exact direction of the vessel's head is indicated at the instant of an observation by means of a post fixed in front of the instrument in line with the keel, and having an index finger projecting over the edge of the horizon ring.

AUTOMATIC VENT FOR CASKS.—Louis Stuhrt, S. F. No. 464,703. Dated Dec. 8, 1891. This is a device which is especially applicable to casks and kegs containing lager beer and other liquids not under pressure. In drawing what are known as still liquors, or those having no carbonic acid gas which is retained in them by external pressure, it is necessary to make some sort of an opening in the upper part of the cask for the admission of air to take the place of the liquid as it is withdrawn. This is especially necessary in the case of lager beer, and in order to provide such a vent which will admit the necessary quantity of air, and at the same time protect the interior of the cask from the admission of foreign substances, and also prevent any escape of gas, which gradually escapes from the beer and is contained in the cask, the present invention has been devised.

PLANE ATTACHMENT.—Geo. H. Melendy, S. F., assignor of one-half to Bennett Bros. No. 464,701. Dated Dec. 8, 1891. This attachment for planes, such as are used by carpenters and others, consists essentially of means for adjusting and compensating the throat to the wear which takes place upon the bottom face of the plane by constant use. With this attachment, the plane can be kept in proper condition much longer. The throat of the plane can be adjusted and retained at the proper size until the plane is entirely worn out.

RAILWAY RAIL JOINT.—A. G. Edmondson, San Buenaventura. No. 464,699. Dated Dec. 8, 1891.

This is a joint for the meeting ends of rails. The object of the invention is to provide a simple and effective connection for the meeting ends of rails, wholly dispensing with the use of pins, bolts or wedges. The lower edges of the fish-plates have lugs which pass down and into slots made in the foot of the rail on each side of the web; said slots being wider than the rails are thick, whereby they enter and engage said slots readily, and being longer than the lugs, provide for the movement in the rails due to expansion and contraction. These lugs serve to connect the fish-plates with the rails. A peculiar stay or bridge fits into a groove in the fish-plate and completes the joint, which is formed without any pins or wedges. This joint is all straight work. It is easy to apply or to take apart, yet when attached will not give way or get loose unless it is broken or the tie upon which it rests is removed from under it. The upward tendency to movement of the rails simply tightens the connection. The fish-plates that are now in use can be adapted for the "bridge," which can be cut to fit the single ones, and the double ones can be cut to fit it.

DICE-BOX.—James R. Slinn, S. F., and Chas. A. Holland, N. Y. No. 464,915. Dated Dec. 8, 1891.

This shaking-box or receptacle consists of a casing having a drop-platform exposed behind a sight-aperture and a swinging throwbar operating under the back of the drop-platform. It also consists in the means for operating these parts, and in the novel construction and arrangement of the device. The object of this invention is to provide a device for the mechanical intermingling and exhibition of independent pieces, such, for example, as alphabet blocks, dice and other pieces, for the chance position and exposure of which instruction, amusement or values may be derived. Interest is lent to the observation of the mechanical operation of the device and the movements of the blocks, by reason of their sudden disappearance, in the first place, their concealment in the bottom of the casing, and their somewhat startling and rapid reappearance upon the platform.

Mining Share Market.

The monotony of the mining share market was relieved the past week by a small up move in the Comstocks. Close observers of the market, and whose opinions are generally well founded on facts, are thoroughly convinced that the pools are "milking" the public of stock, and that at no very distant day we will witness a general deal, based largely on developments in one or more of the Comstock mines. It is said to be a well known fact among miners that about five months ago instructions were given by the stock pools and confirmed by the mill rings, for no superintendent of a mine to make a strike or to develop any rich ore, and if a strike was made, to cover it up. This order was to hold good for at least seven and perhaps nine months. It was hoped that in the interim the public would be worn out, and in disgust sell their stocks at gradually sinking prices. The low prices then put out, to which stocks had to fall, have not as yet been touched. The points are now out for lower prices around the holidays, at which time they are a buy for a big movement similar to that of last spring, only on a larger scale. If such a big up movement is contemplated, what prevents stocks from being a buy now, and if prices go still lower, then buy more, but always pay cash so brokers and rings cannot freeze out those who buy. The work going on in the mines warrants much higher prices and very much higher prices will come in 1892.

Brokers who have fouled their business by aiding the mill rings to elect dummy directors, so as to loot several of the mines, are still opposed to any reformation in giving proxies. We will, at an early day in next year, give the names of brokers who still persist in giving proxies for stock not owned by them but which stand in their names as trustees.

It is given out that the reported combinations to control Belcher, Sierra Nevada and Savage have weakened. This should not surprise any one, if it be correct, for the mill rings and stock pools are opposed to any movement calculating to have the mines work according to the laws of this State, and there are too many brokers who bow the suppliant knee and are even willing at times to receive their master's lash, to bring about the desired reformatory movement so as to have dividends declared and not assessments levied by the different mining companies.

In answer to a correspondent, we will state that the bank checks reported by us in the Hale & Norcross suit were drawn in favor of Evan Williams, who testified that he paid the money to H. M. Levy. Mr. Hobart's public books were put in evidence and are now public property, it is asserted show that the money was paid to H. M. Levy et al on account of dividends for crushing Hale & Norcross ores. If Mr. Levy et al dividends aggregated about \$2000 a month, how much did the rings or "bosses" get? Under such a state of affairs, no wonder need be expressed why Levy kept levying assessments.

A correspondent has sent us a communication attacking, in no measured tone, the management of the Bodie, Bulwer and Mono mines. He asserts that they are so badly mismanaged that even the management of the Comstock mines pales before it.

There is one thing which is hard for the writer to understand, and which he cannot "even up on," to use a miners' phrase, viz.: Mines known to be controlled by Hayward & Hobart, and which they give personal attention to, pay handsome incomes to the owners or shareholders, but the Comstock mines, which report says they control, do not pay dividends but levy assessments almost continuously. The superintendent, A. C. Hamilton, of the latter mines does not even take an oath as to the correctness of his weekly reports as required by law.

Mr. Mackey testified in the Hale and Norcross suit that car sample assays and battery assays should not vary a great deal. Seeing that this is the case, why should not the Superintendent of the Con. Virginia Mining Co. give the car sample assays as well as the battery assays? The Overman Mining Co. gives both.

Reports are current that there is a pending deal in the "razor blade" (Tuscarora) stocks. The public that left the stocks alone on all former deals made money by so doing, but several persons (not insiders) who are said to have dealt in them, committed suicide, owing to heavy losses.

Mining shares opened this (Thursday) morning dull but fairly steady. It looks like a waiting market.

Brokers who, by their proxies, have aided the rings in electing dummy directors, have themselves to blame for the present condition of the mining share market.

All news from the Comstock mines that is allowed to leak out, is confirmatory of the favorable advices heretofore published in this department. The public will find that our advices are thoroughly correct, and that too before the end of 1892, notwithstanding the ring's efforts to decry them and give out, in some instances, false reports.

Our advices continue of a favorable character from the Bodie, Tuscarora and Quijota districts. Several of the Tuscarora mining companies are sending their high grade ore to Utah, where it is sold by sample, leaving, so it is said, a handsome profit to the companies. If milling companies in Utah buy ore by sample, then most assuredly car sample assays, if done by the Comstock companies, would not be such a bad thing to check the looting of mines by rings. Any company, it would seem, that desires it to be understood that they work the mines have the ore milled honestly, ought to insist on car sample assays being taken.

AN HONORABLE RECORD.

It is a singular fact that we have in our city industries older than the city itself, that have been transacting business without intermission since their establishment. This fact alone is a sufficient guarantee for honorable business dealings, and when mention is made of the house of Joseph C. Sala, successor to Mr. John Roach, manufacturer of surveying and engineering instruments, as an example of the above fact, the caption of this article will be readily appreciated by the many patrons of the house and the trade generally.

Mr. John Roach established the business in the City of New York in 1834 and moved his business to San Francisco in 1855, and was successfully engaged in the original line of manufacture until last year, when he was succeeded by Mr. Joseph C. Sala, who was connected with Mr. Roach 30 consecutive years, 20 years of the time as his practical business manager.

In 1862, Mr. Roach, under Mr. Sala's management, made the large transit for the resurvey of the city of San Francisco.

Mr. Sala is now successfully continuing the business of manufacturing and dealing in instruments of precision of the highest grades, and takes pride in maintaining the standard of excellence heretofore recognized as belonging to this establishment, and proposes from time to time to add all real improvements in mechanical construction to suit and satisfy customers. His sole endeavor will be to always maintain the reputation of this ancient house founded in New York City in 1834.

The business is located at 429 Montgomery street, up one flight, southwest corner of Sacramento, where they manufacture all kinds of surveyors' nautical and mathematical instruments. Attention is also paid to the examination of instruments for defects, and when existing, are carefully adjusted and repaired. Supplies and materials for office work constantly on hand. It is only necessary to add that the house of Joseph C. Sala is enjoying the same liberal patronage that its productions have merited in the past, with additions of new purchasers who come to them unsolicited from time to time.

HALL'S MACHINE WORKS.—Among the different mechanical industries of the city, mention should be made of Hall's Machine Works, 44 and 46 Main street. Mr. Robert Hall, the present proprietor, bought out the interests and good-will of Hall & Hedges two years ago, the original firm having been established, at that time, about eight years. While they manufacture all kinds of machinery to order, also shafting, pulleys and steam and water pipe, the specialties of Hall's Machine Works are pumps and pumping machinery. The Banner pump, which will be illustrated in the MINING AND SCIENTIFIC PRESS at an early date, takes the lead in its particular line, but the Ideal, the Smith Standard and the Flat Standard are esteemed by some mechanics among the best manufactured. Mr. Robert Hall shows an honorable business career, and Hall's Machine Works are receiving a fair share of patronage in their different lines of business.

WILLIAMS & ORTON.—Mr. G. V. Orton, 315 Mission St., is not only a practical engineer, but is also a manufacturer of machinery of all kinds from a gas engine to an anchor, being one of the firm of Williams & Orton, who make a specialty of experimental machinery. The firm has been established in the city nine years and presents a fair showing with some of the larger firms in the number, and especially the quality, of machines manufactured by them. Williams and Orton are also partners with Mr. Fillman, under the name of Fillman, Williams & Orton, who supply the trade with X X X gas engine oil. This oil is especially adapted to the heat of the gas engine.

Our Agents.

OUR FRIENDS can do much to aid our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

PACIFIC ROLLING MILL CO.,

.....MANUFACTURERS OF.....

Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

— ALSO —

HOMOGENEOUS STEEL, SOFT and DUCTILE, SUPERIOR TO IRON FOR LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from $\frac{1}{4}$ to 8 inch diameter and flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes; Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogue. Address

THE ORIENTAL GAS ENGINE

IS THE BEST, because it combines simplicity of construction with power and economy in space. It can be run with natural or manufactured gas or kerosene at a cost of 20 to 25 cents per horse power per day.

It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosion. No licensed engineer at a high salary needed to operate it.

Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

MINING MACHINERY FOR CONCENTRATION,

92 CHRONICLE BUILDING.....SAN FRANCISCO.

We have opened our branch here with our specialties in CONCENTRATING MACHINERY and Appliances, and are prepared to investigate any proposition in the CONCENTRATION OF ORES.

Our work in COLORADO, MONTANA and IDAHO is successful, and we present mining men a proposition free from any experimental nature. In many ways CONCENTRATING APPLIANCES IN COLORADO AND MONTANA are more successful than those at present employed on this Coast, and we think we can present a CONCENTRATOR which does not compete with any other, and that has received a cordial welcome from mining men.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880

September 18, 1883; July 24, 1888;

and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

Three Dollars per Annum.
SINGLE COPIES, 10 CENTS.

A Large Electric Hoist.

In a supplementary paper to that read before the American Institute of Mining Engineers, Mr. H. C. Spanning of Boston shows a view of an improved 40-horse power electric hoist for mining purposes, which is reproduced herewith. In the discussion of the original paper, Mr. Spanning said: "I am unable to state with any degree of accuracy the number of electric hoists. I think that the first that I recollect were erected in the West by the Sprague Company some two years ago. That was a small application of their regular railway type of motor to a worm-shaft, and the work since that time has been mainly in the adaptation of different shapes and different designs of motors (series, shunt and compound wound), to the ordinary hoisting drum. The advance has been in securing the regulation of these hoists and getting them to work satisfactorily in the large sizes. In the matter of hoisting, it is really one of regulation and safety, and indeed does not present so difficult a problem as the haulage and pumping, because the hoist is not necessarily (at least not in all cases) subjected to constant dampness. The question of haulage seems to present greater difficulty, and several companies, the Jeffrey, the Sprague, the Thomson-Houston, and others, are working at it all the time."

Gyrating Screens for Coal.

The movable screens are among the most important parts of a breaker, such as was illustrated on the first page of the PRESS last week, from Mr. Cox's paper on the "Iron Breaker at Drifton." The approximately horizontal screen receives a gyratory motion, like the motion a molder gives to his sieve when screening his sand. This is the type of screen used in the iron breaker. Its great advantage is that the whole surface of the screen is constantly in ac-

DOUBLE GYRATING SCREEN FOR SIZING COAL AT THE MINE.

tion, while in the revolving screen of say five feet in diameter, only about eight inches of the 16 feet circumference is at any one time in action, unless the screen is overcrowded, and the revolving of the screen acts like an elevator and tends to throw the coal back into the screen.

The problem of constructing a gyrating screen, when the screen is to be large and must make a great number of sizes, is to support it in such a manner that it will gyrate easily and safely, and at the same time that it will be self-contained, so that the centrifugal force will be counterbalanced and will not shake the building. This has been done successfully.

The figure on this page is from a photograph of a double gyrating screen recently constructed which makes nine sizes of coal, and has three gyrating slate-pickers, namely, for stove, small stove and chestnut. When the screen runs at a proper speed, the inclination required to pass the coal over the surface of the screen is very slight. When first constructed, much larger inclinations were given to the screening-plates. The boxes in this case are 5 feet wide, 6 feet long, and from 2 feet to 4 feet high (inside measurements). From 4 to 8 shelves are put in, making from 5 to 9 sizes. The screen shown in plate, weighs with bed plate, 10 tons. The screening-surfaces have always circular holes, varying from $5\frac{1}{2}$ inches to one-sixteenth inch in diameter. Cast-iron is sometimes used when

the holes are large, but punched steel is now preferred, being much lighter. Copper is used for small sizes when the water is very acid.

About 20 different sizes of holes have been used with coal to suit different circumstances. The sheet-iron lips at the lower end of the boxes are constructed to suit each particular case, so as to discharge the coal on either side of box or at any required point in front. There is no clogging of the holes, as would at first seem likely. The circular form of the holes, and the tendency of the pieces of coal to move in a small circle, cause the holes to clear themselves without difficulty.

DR. J. C. TUCKER, who came to California as one of the members of the Albany and California Mining Co. July 6th, 1849, died at his residence in Oakland on Tuesday. He has held many official medical positions in this State. In 1861 he was the originator of the bill incorporating the North Beach Railroad Co., the first street railroad built in this city. In 1863 he lived in Virginia, Nev. and was on the staff of Gov. Nye of Nevada. Dr. Tucker was a man of literary and scientific attainments and was well known in both this State and Nevada.

FOREIGN VESSELS.—According to the Commercial News of this city, the vessels in port under charter to load wheat on December 22d numbered 57 foreign vessels, having a registered tonnage of 98,882 tons, and not an American vessel under charter. At the like date, there were in the Columbia river 32 foreign vessels loading wheat, and not an American vessel in port.

A LARGE interest in the Sir Davy antimony mine, in the East range 12 miles from Mill City, Nev. has been sold by A. and J. W. French to M. S. Bonfield. The ore will be shipped to market.

FORTY-HORSE POWER ELECTRIC HOIST.

In Favor of Silver.

There was a meeting of silver advocates held at the conrthouse Sunday evening, December 6th, says the *Florence (A. T.) Enterprise*, to join issue with the entire west in making demand upon the general Government for the protection of silver. The United States court being in session large crowds from all over the Territory were present in Florence. Unanimous invitation was extended to the judiciary and members of the legal fraternity, and the hard-fisted, athletic mining element that were inured to many a vexatious hardship, and who were experts in unlocking the hidden wealth of the mountains, had ample accommodation prepared for them.

Several fine selections were played by the Florence orchestra as a prelude to the meeting and at intervals to the close. The meeting occupied one hour and 30 minutes.

The chairman, in opening the meeting, said he trusted and hoped that the hour of depression brought about by class legislation and unjust discrimination would not arrive at such a stagnation as to force us to draw a line between the East and West, and in self-justification raise the cry of our altars and our fireplaces, "God save the West."

The Committee on Resolutions made a report, which was unanimously adopted, as follows:

We, the miners and representative citizens of Pinal, Pima, Maricopa, Gila and Graham counties, of the Territory of Arizona, and being in full accord with the sentiment of our brothers of the other counties of the Territory, and, in fact, standing shoulder to shoulder with the determined, universal and expressed wish of the Pacific Coast, we now make demand upon the general Government that class legislation cease. That we rebuke in unmeasured terms the venal spirit that characterized the so-called statesmen who demonized silver for the benefit of the gold changers. That the silver industry has been almost hopelessly paralyzed, and going from worse to worse year by year. That we join our voices with the late Denver convention, likewise with the one soon to meet at El Paso, and still further on with the one to meet in San Francisco, in no uncertain tone making it mandatory and demandatory upon our law makers at Washington that silver be remonetized instead of being demonized. That free coinage be established and the discrimination between silver in favor of gold be abolished. That the Act which denies the capitalists of foreign nations to seek investment in the Territories be abrogated. We further impress upon our law makers that the people are the Government, and their wishes should be complied with, inasmuch as good government constitutes the happiness and contentment of the people. That the expressed wishes of the entire northwest, west and southwest, together with the agricultural and laboring masses of this great republic, are unanimous in their appeal that silver should be put on a parity with gold, and that there should be no discrimination as between the two metals. That this demand would be kept up unceasingly until complied with. With this spirit and sentiment then, born of a courage that will battle to the end, we send greetings to our brothers throughout the United States engaged in the same righteous crusade, that we will stand by you, fight the fight with you to the last ditch, until victory crowns our efforts, and the pathway of our progressive march will be strewn with the flowers of a triumphal consummation.

TRADE RATS.—A miner near the Senator, recently had a rather singular experience with trade rats, known also as mountain rats. As the nights were cold, the miner took his oracles to replenish his rather hard bed. Having neglected to come to town for several weeks, his supply of beans had given out, and he had to come down to a diet of straight bacon. Considerably out of humor, he started to pull his bed to pieces, one morning, and in removing the covers, was agreeably surprised to find about three pounds of beans, with a little coffee mixed, which trade rats had brought from the Senator and stored in his bed. These rats are native Americans and very different from their imported Norway cousins. They are called trade rats because they generally leave some article in exchange for what they take away. The miner states that he has never killed a trade rat; that these rodents habitually steal from one cabin and carry their plunder into an adjoining one, that on one occasion he spilled a couple of quarts of corn on the floor of his cabin, and the next morning, found the rats had stored every grain of it in a pair of saddle-bags hanging upon the wall. He also states that the rats have thick caudal appendages, about three inches in length, which they keep constantly throwing up and down, striking the floor with each downward movement with the regular and measured stroke of a musical professor marking time. They carry off plugs of tobacco, tooth brushes, combs and brushes, in fact, anything which they can manage to move.—*Prescott (Arizona) Courier*.

RECENT jetty improvements at the mouth of the Columbia river have opened the river to much larger vessels, and a much more valuable trade. The largest ship that ever sailed up the Columbia river crossed the bar and arrived at Astoria week before last. It was the four-masted ship *Alphanietan*, of 2231 tons, from Rio Janeiro in 29 days. Much larger ships from Australia, to load wheat up the river, are expected in the next few weeks.

Desert Reclamation.

Many years ago Dr. C. M. Woznorraft, a well known California pioneer, proposed a plan for the reclamation of a large area of the Colorado desert by means of a canal tapping the stream of that name, and taking much the same course followed by the water that last spring produced the Salton flood. He devoted many years in efforts to materialize this scheme, and even induced Congress to pass an act donating a large amount of land to him provided the reclamation project was carried out. But he died without having accomplished anything more than a mathematical demonstration by means of surveys of the feasibility of his plan. The fact was, Dr. Woznorraft was about 40 years ahead of the times. It was scarcely reasonable to expect anyone to undertake to reclaim any part of the desert so long as this State possessed so vast an area of arable land awaiting settlement under far more favorable conditions.

But the time has come when enterprises of a similar character may be inaugurated with a reasonable certainty that they may be carried to successful completion. Such an enterprise has now been projected near Yuma which upon its face seems practicable, and which has for its object the reclamation of a vast body of desert land lying on the easterly banks of the Colorado. There is a place in the river about 28 miles above Yuma where it is possible to tap that stream with a canal which could irrigate upward of 175,000 acres of land, which, though at present unproductive, is fertile, and needs only the aid of water to become highly fruitful. Below the Arizona line, in Mexico, the same canal might be made to supply fully a million acres. But whether any international arrangement could be reached for such a purpose is somewhat doubtful. There is no doubt, however, about the feasibility of irrigating a large body of American land and the grades are such that the canal need not be extraordinarily expensive.

As the Colorado is a navigable river it is proposed to ask Congress for authority to put in a dam and a lock at the head of the canal, so that navigation shall not be interfered with, but on the contrary, it is claimed, benefited.

There is certainly nothing intrinsically impossible in such a plan as this, and if it can be carried out it will be of the greatest benefit to Arizona and help that territory a long way on its journey toward statehood.

The President on Rural Mail Delivery.

We have already alluded to Secretary Wanamaker's position with reference to extending the free delivery of mail matter to rural districts and the benefits which would accrue therefrom. It is encouraging to note that President Harrison holds similar views, and in his message last week at the opening of the present session of Congress, the following paragraph occurs:

"An appropriation was given by the last Congress for the purpose of making some experiments in free delivery in the smaller cities and towns. The results of these experiments have been so satisfactory that the Postmaster-General recommends, and I concur in the recommendation, that the free-delivery system be at once extended to towns of 5000 population. His discussion of the inadequate facilities extended under our present system to rural communities, and his suggestions, with a view to give these communities a fuller participation in the benefits of the postal service, are worthy your careful consideration. It is not just that the farmer who receives his mail at the neighboring town should not only be compelled to send to the postoffice for it, but to pay a considerable rent for a box in which to place it, or wait his turn at a general delivery window, while the city resident has his mail brought to his door. It is stated that over 54,000 neighborhood are under the present system receiving mail at postoffices where money orders and postal notes are not issued. The extension of this system to these communities is especially desirable, as the patrons of such offices are not possessed of the other facilities offered in more populous communities for the transmission of small sums of money. I have, in a message to the preceding Congress, expressed my views as to a modified use of the telegraph in connection with the States in view."

These are all progressive ideas and will tend to place rural communities on a better plane of advantage and comfort. They should prevail.

A COAL MINE ROW.—Salt has been brought to remove William L. Higgins, A. S. Hubbard, Charles B. Adams, William P. Howland and George B. Tolman from their positions as directors of the George Oscar Coal Mining Company, and to declare null and void a resolution of the defendants, assigning to each of themselves 20,000 shares of stock in the corporation without consideration. Judgment is also asked that the defendants deliver up other shares of stock obtained in a similar unlawful manner, and that they be compelled to surrender possession of all books and property of the corporation under their control. The plaintiffs in the suit are the following stockholders: P. H. Posner, A. E. Brilliant, Henry Fritz, Charles Lalner, B. C. Austin, Mrs. Harriet Austin, N. Frost, Minnie Jellinek, Henry P. Crewe, W. H. Wolkman and Charles A. Peterson.

Water Hints for Desert Prospectors.

Attention is likely to be turned to desert mining by the success realized thus far on the San Bernardino locations of Lum Gray and others. Lack of water has always been a serious obstacle to such enterprises. Many have died for want of some rule by which to secure the life-sustaining beverage, which was, if they had only known it, very near at hand.

Veteran George Fowler, now in town, has spent 25 years in the various deserts each side of the Colorado river and in Nevada. Over 12 years ago, he went 26 miles west of that river to bury a couple of men whom thirst had gathered in. Two Indians guided him. The victims' wooden water kegs had fallen to pieces with dryness. Mr. Fowler then learned to use only metal canteens on such expeditions. He met the Government exploring party in Death valley last winter. Their tanks were covered with asbestos, which kept the temperature cool. To escape sandstorms, by the way, they crawled under rubber refuges.

Water, however, is most likely to be found in the washes, no matter how dry. Mr. Fowler noticed that quails would scratch just above where headrock peeped out from these washes, and found what moisture they needed. Following their plan, he has often sunk from four to eight feet and obtained ample drinking supplies. The water must be there. It sinks to headrock, and when the latter rises to surface, or near it, it forms a natural dam and an underground reservoir is waiting there to be tapped.

Mr. Fowler expects to prospect this winter in Death valley and other nasty portions of Southern California's deserts. Rains then may help him some, but the quail plan of finding water can be depended upon.—*Phoenix (A. T.) Herald*.

Mining Bureau Museum.

Recent additions to the collection of the California State Mining Bureau are as follows:

Tin ore, Redruth, Cornwall, England, from T. H. Simmons.

Vivianite (phosphate of iron), Maple Creek, Humboldt Co., Cal.

A large number of fossils from Humboldt Co., Cal.

Gold quartz and crystallized gold, Bonanza mine, Linn Co., Oregon; A. Halvorsen.

Aragonite, Mt. Downey, Orange Co., Cal.; Geo. F. Hoyt.

Vesuvianite, Santa Cruz Mountains, Cal.

Astrophyllite, large and handsome specimen, El Paso Co., Colorado; J. Z. Davis.

Alexandrite from Fakovja, Siberia.

Agulairite, Guanajuato, Mexico.

Amalgam (crystal), Moschellandsberg.

Arfvedsonite, El Paso Co., Colorado.

Bastnaesite, West Cheyenne canyon, Colorado.

Boracite (crystal), Luneberg, Hanover.

Polybasite, Lawson, Colorado.

Staphaolite, Freiberg, Saxony.

Titania, Tilly Foster mine, New York.

Tridymite, Cerro San Cristobal, Mexico.

Hessite, Lulabua, Transylvania.

Magnetite, of excellent quality, Pope Valley, Napa Co., Cal.; J. C. Sullinger.

First U. S. cent, the "Franklin" or "Ring" cent; Horatio N. Russ.

Rubellite (red tourmaline), San Diego, Cal.

Black and green tourmaline, Graphic granite and Lepidolite in several varieties from San Diego, Cal.

Rich tin ore and inclosing rock of the vein, Temescal mines, Cal., from the company.

THE ALIEN LAW.—The passage of the Alien law by Congress, which applies only to Territories, has had the effect of keeping millions of dollars out of Arizona since its passage. Under the Alien law, foreigners cannot purchase mining properties in any of our Territories, and this capital has been kept away. No less than 7 important sales which would have aggregated over a million and a half dollars to Southern Arizona, have been defeated within the last two years simply because an English and French syndicate could not receive a title to the mines in Arizona. When Arizona becomes a State, this condition of things will pass away; and while the miner will be the greatest beneficiary, the Territory at large will be largely benefited by the increased amount of taxable property, and the employment of labor as well as the production of bullion. No class of people will receive greater benefits from Statehood than the miners and prospectors, hence it is plain that they will all vote for the Constitution and Statehood.—*Tucson Star*.

TIMBER LANDS.—The laws of the land permit the use of timber in certain States and Territories for mining and domestic purposes, but the authorities at Washington never tire of imposing onerous conditions on the people for the enjoyment of a legal right. As for instance: Commissioner Carter of the General Land Office has issued a form of permit to be granted persons applying to cut timber from public lands. Among the stipulations is one forbidding the cutting of more than 50 per cent of timber of that class growing on an acre. A monthly statement under oath is required, giving description of the tracts from which the timber is taken. No trees shall be cut or removed of less than a specified number of inches in diameter, except for a needed roadway through the timber. The person cutting the timber is required to cut, remove, burn or otherwise dispose of the tops and brush of the trees, etc., to prevent forest fires, and will be held liable in damages for the spread of fires attributable to his neglect.

The Water Front of San Francisco.

The Sea Wall, Belt Railroad and Grain Warehouses.

The water front of the city of San Francisco does not belong to the city of San Francisco at all. It belongs to the State—the people of California—and the city spends no money on it and receives no money from it. The whole water front is under charge of a Board of State Harbor Commissioners, who build the sea wall and wharves, receive and spend the income from tolls, wharfage, rents, etc., and conduct the business on behalf of the people of the whole State. These facts should be borne in mind by people in the interior, many of whom have an idea that the city itself charges excessive tolls on commerce and reaps all the benefit. San Francisco itself does not own a single wharf, warehouse or dock, and in fact no private individuals own any water front landing places outside the line of the sea wall. The whole thing is State property.

As far back as 1851, when improvements began on the water front, it was seen that a retaining wall around the city front and the filling in of the lots and streets adjacent would be necessary to obviate the constant cost of repairs and allow the erection of a better class of buildings. The teredo destroyed the piles and hoof and wheel made short work of the street planking.

The subject began to be discussed and made its appearance in the Legislature in various ways. It assumed definite shape, however, in 1860, in the bill to grant the right to construct a bulkhead (or sea wall) to a corporation known as the San Francisco Dock and Wharf Co. This measure was advocated and resisted with ability and persistence on both sides, and as will be remembered, after passing, was wisely killed by an executive veto. The contest, however, settled two points, viz., the necessity of the sea wall, and that it should be constructed by the State and not by private parties. In 1863, the Act was passed creating the Board of State Harbor Commissioners and instructing them to begin the construction of the sea wall. A plan was reported in 1865, and contracts let for two sections in 1867. Since then the work of building the sea wall has gone steadily on, until now, it is completed from the Market street ferries as far around as the old Meigs' wharf at the foot of Powell street, and an additional section under construction to beyond Taylor street. The map which is printed on the opposite page will show the extent of the work completed.

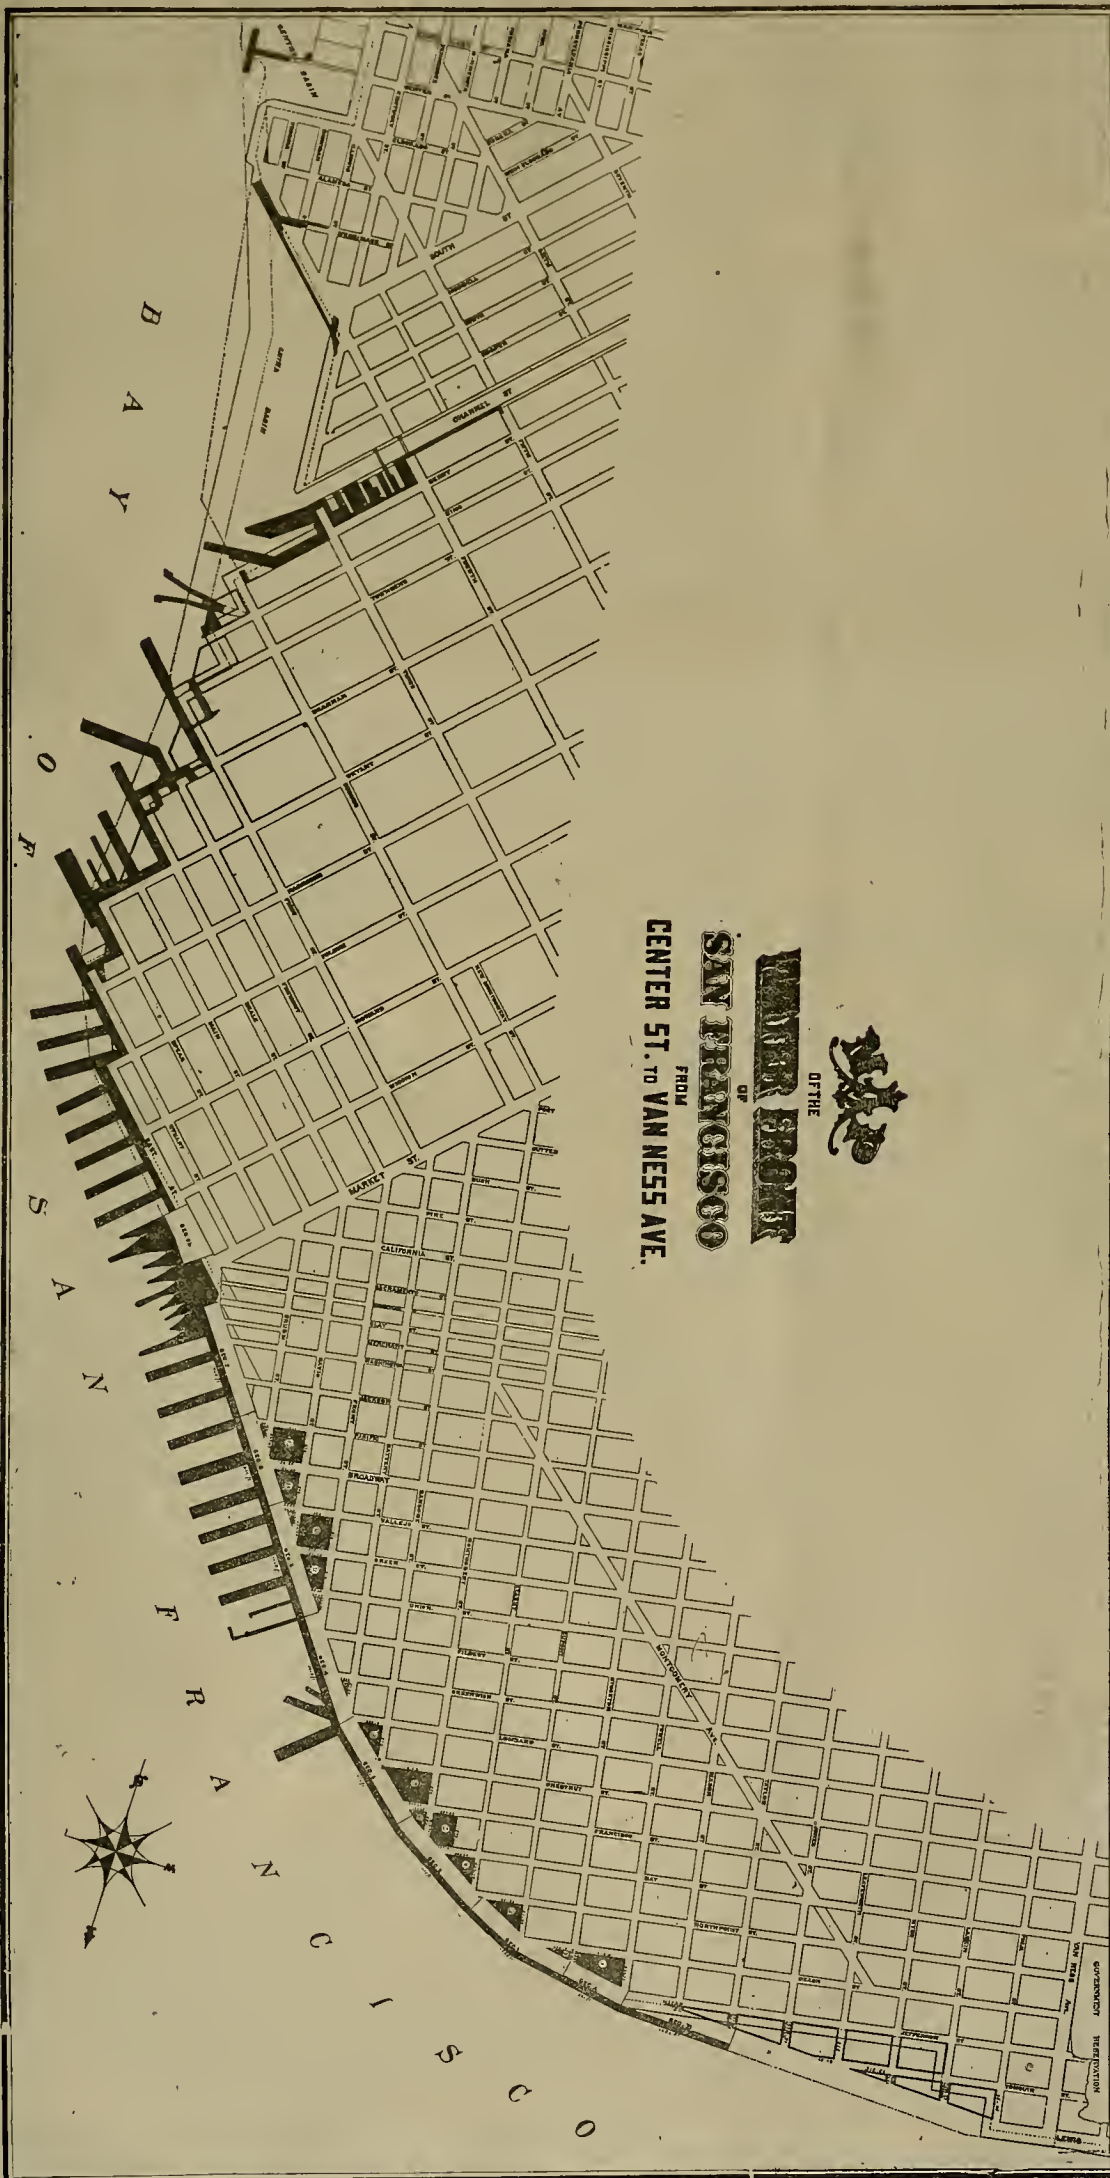

In the early days wharves were built without any general plan, and the zigzag lines of those wharves had to be straightened by the engineers of the Commission. A line was fixed for the sea wall in a general curve entirely around the city front, parallel to the movement of tides. As fast as a section is completed, wharves are extended from this wall, at which ships may lie.

The sea wall itself, is simply a rip-rap embankment of stone, which is thrown loosely into a channel dredged about 60 feet wide and 20 feet deep, and carried up with a proper slope to the official grade. It is a retaining wall, against which the water front streets and lots may be solidly filled in. The original plan of a concrete facing was entirely abandoned as of no practical use and involving great expense. The only exception to the system of construction described, is immediately at the foot of Market street, where the ferry landings are. Here they built a solid wall of concrete, now partly completed, and filled in behind that with sand, a foundation first being prepared by driving piles close together and placing upon these heavy planking. This was done inside of the concrete wall, and in front of the space thus prepared the new ferry buildings are to be placed.

As the sections of the sea wall proper are completed, the space inside is filled in and brought up to grade. The streets are then laid out and paved with basalt blocks. A fine, wide thoroughfare has been completed and paved from Foley street to the foot of Stockton at North Beach, and this will be eventually continued entirely around the city front to Mission bay at the south and Van Ness avenue at the north.

Outside of the sea wall, and at right angles with it, extend the system of piers or wharves. These reach out to an established "pier-head line" generally parallel with the sea wall, arranged so as to secure the full sweep of the tidal currents. The dockage room for shipping

MAP OF THE WATER FRONT OF SAN FRANCISCO.

is between these wharves. As will be seen by the map, no right angle piers have been thus far built beyond that at Lombard street; and along the wall north of that are the great wheat warehouses, of which more will be said further on.

The work on the section at the foot of Market street is, as has been stated, different from that on other portions of the water front. The sea wall as built there, will serve as the foundation for the west front of a large passenger depot, designed to be about 800 feet long and 150 feet wide. The east front will rest on heavy concrete piers, about 40 feet apart. The building is designed to accommodate the passenger traffic reaching the foot of Market street. It will be several stories high, with a central portion one story higher. The second story will be reached by a steel bridge over East street and extending to the south side of Sacramento street, and connected directly with the upper decks of the ferry steamers. The principal materials of construction will be iron, steel and glass. The building, with its bridge and approaches is estimated to cost about \$504,000.

In order to put up these extensive ferry buildings, and at the same time continue the necessary work along other parts of the city front, the Commissioners found they would have to anticipate their income, (which is contrary to law) unless the State made a special appropriation. As a special appropriation would naturally increase taxes, and this was not desired, the last Legislature was asked to let the board issue bonds for \$600,000 for the construction of the new depot. This proposition will, therefore, be submitted to the people at the next general election.

Since the laws creating the Board of Harbor Commissioners, and defining its duties and responsibilities, were passed, additional duties have been imposed. The concentration of a vast local and transcontinental passenger traffic at the foot of Market street, and the need of building a belt railroad around the State's water front properties, have imposed obligations upon the board beyond the limits of their present revenues. There can be no doubt of the advantages to the State at large of the past policy of the board regarding the absolute ownership and control by the State of all the water front property, and the structures thereon. No person, nor corporation, should own any structure whatever upon the State property, nor should such structure, when built by the State, be under the exclusive control of any person or corporation.

Although the time is at hand when the public need for suitable passenger accommodations at the foot of Market street is great, and our commercial necessities demand the most complete facilities for rapid handling of freights, no step should be taken which would, in any way, tend to impair the absolute control by the State of the vast interests of the water front. The direct revenues of the board are sufficient, when wisely expended for the maintenance and extension of the water front and sea wall, as originally provided for by law, but not for meeting the additional burdens above mentioned. It is believed that these burdens may be borne without the addition of one dollar taxation upon the citizens of the State.

The issuance of these bonds will not bring taxation on the people at large in any way. They will be paid out of the income of the Commission, which is about \$600,000 a year. This income will be greatly increased when the entire belt road is completed. The railroad companies pay for the privilege of using this belt railroad five cents per ton on all freight passing over it, and 50 cents per car, besides the rent for the depot room or freight sheds. At the new ferry landings the railroad companies pay \$600 per month for each steamer slip (and there are eight slips), which includes the use of the present ferry passenger depots. Since the Southern Pacific Company uses most of the passenger depot, many people suppose it is to be built for their benefit alone, but this is not the case. They must pay for its use, and these payments go toward paying for the improvements. The people are not taxed for it at all, nor will they be. Every person who comes to or goes from San Francisco uses these ferries, and the new buildings will be a very great convenience.

It should be here stated that the State has now reclaimed from the bay, by the construction of the seawall already built, over 30 fifty-vara lots worth at least \$1,500,000. By the extension of the seawall westwardly to Van Ness avenue at a cost of about \$440,000, an equally large and valuable area will be reclaimed. The grading of these lots will cost about \$200,000, so that by this extension (on which work is now going on), at a gross cost of \$640,000, the State will be in possession of additional property of a minimum value of \$1,500,000, as well as that now reclaimed. There is no need of funds for carrying out this work, as its prosecution comes under the regular expenditures of the San Francisco Harbor Improvement Fund, as provided by law. In a few years the State lots will aggregate over 60 fifty-vara lots, and a value of at least \$3,000,000. These lots are shaded on the map so their location can be understood. The lots are used for lumber and car yards, freight depots, coal platforms, steamer repairs and stores, offices, etc., by the Commissioners.

One of the most important features in connection with the water front is the belt railroad, of which the first section has recently been put in operation. It will ultimately be

(Continued on page 421.)

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

NEW LINDEN.—Amador Ledger, Dec. 19: We regret to state that operations at this claim, near Plymouth, have come to a standstill. The owners, Messrs. Ballard and Martin of San Francisco, have spent a fortune in a thorough and systematic prospecting. It is estimated that they spent, from beginning to close, over a quarter of a million dollars. The hoisting machinery and 40-stamp mill are equal to any in the State. They have searched the ground in all directions to the depth of over 1000 feet, only to meet with disappointment. Some good ore was discovered, but not in paying quantities. The explorations have extended over a period of five or six years. They have now come to the conclusion to quit entirely. Underground work has been suspended, and the machinery is to be taken out and removed to other mines in which the owners are interested.

MISCELLANEOUS.—The ten stamps of the Amador Queen mill were expected to commence the work of crushing yesterday. The ore is known to be low grade, and a test crushing will demonstrate whether it can be satisfactorily worked.

ACCIDENT.—J. W. Smith was killed at the Kennedy mine last Sunday by a timber falling upon him and knocking him 500 feet down the south shaft.

OLETA.—Our mining enterprise is running along very nicely. The sound of the whistle makes one feel like having new life. We hear they have struck gravel in the new shaft, which prospects well. We challenge any company to put a more complete plant in the way of machinery than Messrs. Davis and Campbell.

WOODBURY CONCENTRATORS.—Amador Dispatch, Dec. 19: Geo. E. Woodbury of San Francisco, inventor of the improved concentrators hearing his name, was in Jackson this week looking after some of his machines which are being put up in the Amador Queen mill in Hunt's gulch, which is about ready to again commence operations.

Nevada.

THE CENTENNIAL.—Transcript, Dec. 17: At the Centennial drift mine, the upraise above the main tunnel toward the surface for air and water purposes is now up 125 feet; face in hard, dry cemented ground. Main tunnel continued south beyond foot of the upraise, 45 feet; and another upraise for the gravel bed exploration will be made shortly.

MINE BONDED.—Grass Valley Telegraph, Dec. 17: Wednesday, a working bond was given to Col. W. J. Sutherland and others on the Golden Treasure mining claim. The Golden Treasure is what has been known as the Sauvee ground, and is in near the Empire, W. Y. O. D. and other famous properties. It has a fine hoisting and pumping plant on it, and the company that has secured the bond is a strong one, and will begin operations early in January.

GRANITEVILLE DISTRICT.—Henry Cochran and his partner evidently have a valuable piece of property in the Hooser quartz claim, which is situated four miles east of Graniteville, and near Bowman dam. The tunnel is in 300 feet on a ledge that averages about four feet in thickness. A crushing was made recently at the Baltic mine, and paid so well that the owners propose to build a mill next spring.

DIAMOND CREEK DISTRICT.—O. M. Easton has bought the Chase & Saunders and Forest or Dill gravel claims on Diamond creek, about two miles above where that stream joins the South Yuba river. The tunnel, 180 feet long, which Curtley ran in the '60s, and which he abandoned just after he had passed through the rimrock and into the channel, has been cleaned out 100 feet by Mr. Eastman, who finds it so badly caved beyond that point that he will have to make a new one from there on. The claim has been named El Monte by the new owner, who soon expects to have the first systematically worked and paying drift mine in that part of the county. Adjoining the El Monte on the southeast, Fritz Meister and J. S. Spring have a claim in which they have since last summer run a tunnel 100 feet. They will soon make an upraise, as they think they are under the channel. Diamond creek, which is in Washington township, paid fabulously in early days as a placer-mining region, and the lead which the above gentlemen are now prospecting for has given good returns to various prospectors. Whether or not it will pay for drifting remains to be seen.

NEVADA CITY.—Transcript, Dec. 19: The new hoisting and pumping machinery for the Odin drift mine is being set up, and will be running about Christmas Day or shortly after. The putting in of the new pumps at the Providence mine is almost completed, and when they are started, it will take but a short time to get out what little water is accumulating while the change is being made. Capt. John A. Rapp has one of the best prospects not only in this immediate vicinity, but in the county. He is sinking on the Stiles ledge from the east side of Roger Williams' ravine, and at a point 700 feet north of where considerable work was done many years ago in an effort to develop the same ledge. The incline is down 35 feet, shows ore all the way, and in the bottom the formation is 3 1/2 feet thick. The quartz presents a very lively appearance, is heavy with sulphurets and carries some free gold. It will, in the opinion of experienced miners, pay \$30 or more a ton. Robert Hughes and Morris Green this year located a claim on Rush creek, half a mile west of the Green ranch. They washed off 40 feet of soil and uncovered the ledge, but the ore contained very little gold. They then sank. At a depth of 40 feet pay came in. They now have their incline down 70 feet and it shows a foot and a half ledge that will, perhaps, pay \$300 a ton. Water is coming in so fast that they must get heavier pumps.

MOONEY FLAT DISTRICT.—The old Wheaton mine, which is being operated by C. F. Ayer, is working about the usual force of men, with good prospects. The persons who leased the old Ayer mine in Mooney Flat are making quite a fortune. Last week they retorted 23 1/2 ounces of pure gold for one week's run. This is a very large cleanup for one week, considering the fact that there are only eight men working.

CANYON CREEK DISTRICT.—There is at the Narrow Gauge depot here, a cannon ball quartz crusher of English invention, which is en route from San Francisco to the Waldeck mine on Canyon creek. There is one like it in Auburn, where it is giving satisfaction. They are quite common in South Africa. The machine has a capacity of three tons a day. Fritz Meister, the owner of the Waldeck, and who also has a bond from George G. Allan on the Canyon Creek claim, which is a parallel ledge, has a lot of quartz out, and good judges say it will average at least \$50 a ton. Samples of it assayed at Salt Lake gave a return of \$700 a ton. The formation is so large and so handily worked, if it goes \$50 a ton right along, Mr. Meister will make a fortune out of it.

Placer.

BONDED.—Placer Herald, Dec. 19: J. M. Bryan, an old miner of these parts, after operating in Mexico and other mining regions, returned here a week ago and has bonded the Conrad mine on Duncan Hill. He has put on some men, sinking at the same point where Thorpe and Kennicott a few years ago took out \$2500 at a depth of 15 feet. Those who know the lead think Bryan will make it pay.

Plumas.

THE CONSIGNEE.—Plumas Co. Bulletin, Dec. 17: Pit Trayner, Supt. of the Consignee mine, above Cromberg, was in Quincy Monday. From him we learn that work has been suspended temporarily on the Consignee in consequence of the freezing of the water which furnishes the power for the "blower." As soon as the weather moderates, work on the property will be resumed. The tunnel is now into the mountain about 200 feet. It will be pushed ahead to bottom the channel. A former tunnel run by the company proved to be too high. The stockholders of the company live in Pittsburgh, Pa. They have faith in the development of a big mine where they are now operating, and miners acquainted with that part of Plumas believe they will be successful. Breaks from the channel now sought have yielded large quantities of gold. Mr. Trayner is an experienced miner and a good manager. He will push work actively during the coming season. Chas. Mayn and R. Burnett continue work on their mine, about two miles from the Consignee. They are driving the tunnel ahead and hope to reach the channel soon. John Porter and Wat Bell have leased a small part of the mine owned by Thomas & Thompson, near Quincy, and they are now working it with good results. Stratton & Hubbard are reported to have done well the past season in their mine at the head of Poplar creek.

San Diego.

RUBY.—Julian Sentinel, Dec. 19: A new car arrived for the Ruby mine this week, and work can now be pushed much faster. Things are beginning to move at the Wilcox mine under the new management. W. D. Chambers is a hustler, and under his supervision these mines promise to develop into paying properties.

Sierra.

SIERRA CITY.—Mt. Messenger, Dec. 19: Salines & Mercer Co. are pushing their tunnel ahead and stopping out rock for their mill. Cleveland Co. employs 15 men. Its 12-stamp mill is running and ore said to be paying well. Water has frozen and ditch recently broke at the Marguerite quartz mine, causing temporary stoppage of work. Ten stamps are running at the Colombo, where good-paying rock is being milled and 18 men are employed. A full crew is working at the Young America, and the mill is crushing ore. The prospect is very favorable for a prosperous future. Wm. Tell Co. has completed its 300-foot contract, and the ledge widening. Another of 50 feet has been let. Four men, two shifts, are working. Butte Saddle G. M. Co. is pushing its main tunnel ahead for the second pay chute that may be reached at most any time, according to the surface croppings. Chips Co. was working 20 men before the late cold snap, but not so many since on account of scarcity of water. Its 12-stamp mill is running. A full crew is on the pay-roll. The Chinese who bonded the 1001 drift mine for five years have obtained a good prospect. Lead is over 100 feet wide. The claim will be put in thorough working order at an expense of about \$5000. A flume costing \$6000 is to be laid to the head of Deer Creek, six miles from their diggings. Mountaineer Co. is running its tunnel for a second ore chute. Six men are busy. Its ten-stamp mill is running. Far as chimney has been followed (75 feet), sulphurets have been black, very similar to those of the Young America. Two hundred feet more of tunnel will bring face under the second pay chute. Sierra Buttes Co. has struck another pay chute in No. 2 tunnel, new ground, and its ten-stamp mill, up on the side of the mountain, at No. 2, is steadily crushing ore. If this chimney continues going down, quartz therefrom will be eventually carried out of Nos. 8 and 9 tunnels to be worked in No. 9 mill, where 40 stamps remain in view of probable future operations. Mr. Thomas has charge of the property, under whose efficient management affairs are favorably progressing. No. 3 tunnel at the Mountain mine is being pushed ahead, and a large chute of pay ore has been discovered averaging from 10 to 30 feet in width. Messrs. Flint and Parker have the contract for running No. 3 tunnel through the mountain toward the Young America. Soon as spring opens, a big crew of men will be put on to run the 40-stamp mill. Sierra City people are very much rejoiced over the favorable outlook for this promising mining property. Jas. Hagerty, general manager, sees that work is energetically and advantageously prosecuted during the temporary absence of Geo. M. Pinney in Mexico. Ten stamps are crushing ore at the Phoenix. Rock averages \$8 a ton. Twenty men are employed. Main tunnel is 700 feet long. One chimney is being worked, followed for 600 feet. Seventeen tons of ore are crushed daily. Emile Shultz, architect of the Phoenix mill, ably assisted by J. H. Henderson, merits and receives much credit for the workmanlike and durable manner in which it has been constructed. Thos. Brennan is secretary and treasurer of the Phoenix mine. Its sole owner, our well-known and esteemed supervisor A. C. Busch, appears happy and contented over the recent monthly cleanup of \$4000.

Shasta.

A PROSPECT.—Redding Free Press, Dec. 19: D. H. Castle, who has been prospecting a mine in the French Gulch district, about one mile from the Gladstone, came down this week, there being too

much snow in that section. He brought with him a bag full of sample ore which makes ones' eyes glisten to look at. The ore shows rich in gold and also contains copper. Castle and his partner, McKee, have run in on the ledge 60 feet and have taken out some 20 tons of ore. They have also constructed a road nearly to the mine; about three days' work will complete it. The rock that he showed us would pay handsomely with a hand mortar.

Tuolumne.

BUCHANAN.—Union Democrat, Dec. 19: The Buchanan mine has discharged a number of men who were employed in the old shaft. The men working in the new shaft, which is situated on the old Francisco claim, will be retained; but it is not probable that many men will be employed at the mine during this winter. Heretofore, a full force was required winter and summer to run this well-known mine, but a new departure has been resolved upon. The water has been turned on in the great mining ditch running through our eastern camps, and mills which have had a period of enforced idleness are preparing to resume operations. Wilbur Long came in from the New Albany mine last Sunday. Wilbur reports four men at work in the mine. The ten-stamp mill is kept running during the day, and is fed with ore from the 100-foot level, which is looking well. The main shaft of the mine has been sunk to the depth of 800 feet. James Gloster has uncovered a fine-looking vein at Spring Gulch. It is four feet wide and yields a fine prospect. Spring Gulch has been an excellent mining neighborhood, and as Jim is one of the best prospectors in California, we expect to hear of a big find. The Kincaid Flat Gravel mine started up this week, with persevering, energetic P. J. C. Reylard as superintendent. Five men are employed at present, but soon an additional force will be put on. This week, Louis Blanding, the metallurgist and mining expert, visited the Garibaldi mine, situated on the Calaveras side of the Stanislaus river. The property has been under Mr. Blanding's immediate superintendency, and through his judicious and energetic management has been fully developed.

ALICE.—Tuolumne Independent, Dec. 19: The Alice mine at Jackass Hill, from which Hank Gale took \$14,000, and others took as much more, is now leased by Mr. Wickham, who recently found a prospect and is now in to as handsome a formation as one would wish to see. The quartz is thickly shot with sulphurets and iron cubes, the slate is highly metallized, and there are feeders and crossings in sight.

NOONDAY.—The shaft of the Noonday mine is now down 125 feet. The vein is 18 inches wide, and mills \$100 per ton. The sulphurets have not yet been worked, but a test shows them to be very rich. The mine is owned by John Woodside, Al Butheuth and F. H. Warner.

NEVADA.

Montgomery District.

A GOLD CAMP.—Pioche Record, 12: News of a most encouraging nature has just come from the new gold regions of Southern Nevada. A 20-stamp quartz mill is already on the ground. Miners and prospectors are hastening hither from all directions. An authentic report says that the Montgomery M. Co. has a quartz ledge which assumed the enormous width of 24 feet and is exposed along the surface for almost the entire length of the claim; two ounces of gold to the ton are said to be contained in the rock. Montgomery district, which was either discovered by Wm. Montgomery or the Mackey Bros., of Pahrangat valley, is located in Nye county, Nevada, 150 miles southwesterly from Pahrangat valley, and close to the line of Lincoln county. Shortly after the discovery of a permanent gold-bearing ledge, Mr. Montgomery formed a company of California gentlemen and began active and systematic prospecting. Subsequently, last spring, a two-stamp test mill was erected and put into operation. After thoroughly testing the ores by the milling process with this small plant, the company became assured of the great success of their enterprise, and forthwith gave orders for a 20-stamp quartz mill, the last of which is now on the ground. Millmen have been put to work and the plant, it is hoped, will soon be completed and put into active operation. The work of piping the necessary water for about five miles to the millsite is also being put through with diligence. The principle vein to be operated by the Montgomery Co. is said to be 24 feet in width, exposed along the surface 125 feet and developed down for a distance of 150 feet. This company has, in addition to the above property, taken a bond on one of the principal claims owned by the Mackey Bros. and adjoining their own; the terms of which are not made public. The mill was taken from this seemingly bright spot by way of the Southern Pacific railroad of California to Daggett, from whence it was hauled by wagon over 160 miles in a southeasterly direction. The prospectors are going in nearly all directions, being attracted by the glowing reports that are now becoming current. Last month every foot-loose miner and some others left Pioche for that section. Two-ounce free-milling gold quartz is not to be sneezed at. The location, it is true, is a little remote, but the freight on gold bullion, figured at so much per ton will not likely be thought burdensome. Further information is learned from an interview with Edward Shean, a prospector and miner, who is just in from the district. He says the future of the camp, in his opinion, is fully assured; but the immediate outlook is not pointing toward any particular rush. The Montgomery Co., he claims, owns ten mines already and still shows a tendency toward gathering more. The main claim, evidently the one formerly described, he said, is about 14 or 15 feet in width and assays from \$12 to \$15 in gold. The 20-stamp mill is not a 20-stamp mill, but a Huntington mill, which is about equivalent in its crushing capacity. The camp is a good one for prospectors to go to, he continued, provided they have plenty of money to put up for supplies which are worth more than double what one could get them for at Pioche. But it is no place for a man to go to looking for work, as the ore is too easily mined and there is none other than the one company operating there.

Robinson District.

AN IMPORTANT LEASE.—Eureka Sentinel, Dec. 19: A. Jackson and Nathan, Kind & Co. have leased the Keystone mine of Robinson district, White Pine, to Chas. Rudeen, Gus Benson and Andy Olsen for a term of 28 months. Consider-

able new machinery is to be added, and the mine put in thorough order at once. The lessees are skilled in leaching and will work the ores by that process. They are also first-class miners and responsible business men. We anticipate that they will make a complete success at Robinson. The past record of the Keystone is good, and there is still a great deal of ore in sight. Featherstone, who formerly owned it, used to ship ore here by team that worked \$200 per ton. The many friends in Eureka of the lessees will wish them the greatest good luck in their new field.

Pine Nut District.

A REVIVAL.—Carson Tribune, Dec. 17: All Carson is again excited over Pine Nut. Joe Rayerat brought in this morning several sacks of ore from the Snow Flake claim, one of the series of locations belonging to the Monarch Consolidated, that discounts anything seen from the Zirn mine. The ore was taken from a shaft 18 feet deep. It is decomposed red quartz, and is studded with gold from the size of a pin-head to that of a pea. The location is about a mile and a half southwest of the Zirn mine. About a dozen shafts have been sunk in a range of four acres, and good prospects found in all, so it is generally believed that an extensive ore deposit exists. This strike, following that in the Zirn mine satisfies all Pine Nut locators of the richness and extent of the ore body; so look out for another rush to Pine Nut.

Tuscarora District.

NORTH COMMONWEALTH.—Times-Review, Dec. 18: Hoisted 25 cars second class ore, \$45 per ton, and shipped to railroad 31 tons first class ore; will assay \$450 per ton.

DEL MONTE.—Second level—Joint raise in the vein, extended eight feet on the line, continues to expose good ore, two and one-half feet being high grade, assays from which return \$275 per ton.

COMMONWEALTH.—Fourth level—South drift from No. 2 raise advanced 15 feet, ore coming in the face of the drift.

NEVADA QUEEN.—Second level—No. 1 south drift advanced 10 feet, showing some good ore. No. 2 south drift extended 18 feet.

NORTH BELLE ISLE.—No. 3 north drift, 400-foot level, has been advanced 20 feet, the vein is three feet wide, part of which is first class ore. No. 2 winze, below the intermediate drift and above the 400-foot level, sunk 10 feet, giving low assays. South 500 from Belle Isle crosscut extended 15 feet, giving low assays. The stopes above the 400 and 500-foot levels are producing as usual.

NAVAJO.—No. 1 upraise, 150-foot level, extended up eight feet, the vein is not looking so well. No. 3 upraise, below 350-foot level, extended up 16 feet and connected with the level. Have started a winze from 350-foot level.

BELLE ISLE.—North Drift, 150-foot level, has been extended 140 feet in hard rock. Line crosscut on 350-foot level extended 11 feet. The stopes on Nos. 2 and 3 veins are producing as usual.

Tybo District.

THE NYE CO.—Belmont Courier, Dec. 17: It is to be hoped that the negotiations now pending for the sale of the Nye Mining Co.'s property at Tybo, including the famous 2-G mine, will be consummated. Then will our Tybo neighbors enjoy lively times again. Tybo is undoubtedly one of the best mining districts in Eastern Nevada.

Washoe District.

HALE AND NORCROSS.—Virginia Chronicle, Dec. 19: On the 1650 level, the north lateral drift from the new station is advanced 100 feet; face in quartz and porphyry of low assay value. East crosscut No. 1, started from the north drift at a point 75 feet north from the station, is advanced 35 feet. The last 12 feet of this crosscut is in low-grade quartz. On the Sutoro tunnel level, the south drift was advanced 30 feet, making its total distance south from the station 165 feet; face is in porphyry. West crosscut No. 1, started from south drift 100 feet south of the station, was advanced 35 feet, making its total distance 75 feet; face in porphyry and quartz. Have sent through the Sutoro tunnel 520 cars of waste rock during the week.

SAVAGE.—During the week, we have hoisted 663 cars of ore from the 500, 750, 950 and 1100 levels, and shipped to the Nevada mill 545 tons, and milled 530 tons, average battery assay, \$18. We have bullion on hand amounting to \$12,674.68. On the 1450 level, we have commenced putting in square sets and stopping out ore from west crosscut No. 1. The ore is fair grade.

BELCHER.—Have stopped the north drift from the 300 level station and run a west crosscut from the north end of it a distance of 40 feet. It disclosed a width of about 29 feet of quartz, but of too low a grade to extract. Will start a raise from the lateral drift, with the intention of cutting this quartz at a point between the 300 and 200 levels, to ascertain if the quartz improves in grade at that point. Are saving from eight to ten tons of fair-grade ore per day from the south drift from the fifth floor of the raise above the 1300 level.

KENTUCK.—Have stopped the west crosscut from the north lateral drift on the 500 level, and have started an east crosscut opposite it, which is out 13 feet. The face is in a mixture of quartz and porphyry giving low assays. The east crosscut from the bottom of the 1000 level, north winze, is now out 55 feet. The face is in low-grade quartz and porphyry. Are still following south on the ore streak from the 100 level, north raise, with nothing new to report.

JUSTICE.—The raise from the east drift, 612 level, was advanced 10 feet during the week. The top is in a mixture of clay and porphyry. The south drift from the top of the raise, same level, is now out a total distance of 30 feet; face in quartz giving low assays. The north raise on the 622 level is now up 46 feet. The top is in low-grade quartz.

CROWN POINT.—West crosscut No. 3, 500 level, is now out a total distance of 60 feet; face in porphyry. This crosscut has about 25 feet to go to reach the quartz encountered in No. 2 crosscut. The west crosscut from the south lateral drift, 600 level, is now out a total distance of 323 feet; face in hard porphyry.

CONFIDENCE-CHALLENGE.—The joint Confidence and Challenge north lateral drift, 200 level, is in 999 feet; face in quartz of no value. The joint Confidence and Challenge drift on 300 level is now in 588 feet; face in quartz of no value.

IMPERIAL.—The raise from the 400 level is up 400 feet; the top shows quartz having no value. Are still taking out some ore found in the old fill-

ANCHORING.—The new guides in the Anchor shaft being properly placed and all arrangements completed for putting in another cable as soon as the new wire cable arrives from New York, and it is expected every day. Active sinking will not begin until the new cable is ready to run, though some little work is now being done. A shot put in the other day blew out a piece of the iron casting in the bore-hole, and considerable trouble was experienced in getting it out. Every precaution will be taken to prevent a bore-hole from clogging and no serious trouble is anticipated.

MECHANICAL PROGRESS.

Possibly an Expensive Mistake.

It will be recollected that after our naval engineers had presented their plans and specifications for the construction of the war ship Philadelphia, lately launched, that the Secretary of the Navy was not altogether pleased with the plans as furnished and actually purchased from Sir William Armstrong & Sons, shipbuilders on the Tyne, England, some important modifications of the American designs and had them interpolated. This was done against the earnest remonstrances of both the designers and builders.

Since the launch the public has been somewhat startled by the publication in the New York Times of articles which seem to establish the fact that a serious mistake has been made. In these articles it is claimed that the ship, by such changes, has been given so low a metacentric height as to make it more than probable that she would roll dangerously in a rough sea, if indeed she did not turn bottom upward. This is thought to be due mainly to the fact that considerably lighter machinery was put into the vessel than the original designs called for, thus reducing the weight below the water line, while a protective deck, heavier than that contemplated by the original designs, increased the weight above the water line, the result being that the vessel is dangerously top-heavy. It is estimated by Naval Constructor McIntyre that \$275,000 should be spent in alterations upon the vessel, which, if it turns out to be necessary will prove quite an expensive lesson as to the risk assumed in materially altering a design for a structure of any kind without going over the whole work in the most thorough manner.

It ought to be a well-understood fact that when alterations of any moment are to be made in the designs of an important structure, there is usually no safe plan except to go through every step in the designing of the complete structure as amended.

It should also be further understood that we have in this country as skillful engineers and constructors as any which can be found in Europe. If the lesson, which, in all probability will be taught by this inexcusable blunder, does not cost the Government over a quarter of a million dollars it will be fortunate. It is full time that the influence of the anglo-maniacs of New York, in both the financial and political administration of the Government at Washington was wiped out and that forever.

THE TRAVELING SIDEWALK, to which invention allusion has already been made in these columns, is being put to a practical test at the Chicago Exhibition grounds, where a circular walk has been built. Max E. Schmidt is the inventor. It is said to be attracting considerable attention among engineers, numbers of whom have been invited to inspect it in operation. It consists of an elevated series of continuous sidewalks, parallel and level, and so arranged that the first moves at a slow rate of speed, and each successive one at a speed double that of the preceding. The motive force is supplied by electric motors attached to the trucks and situated several hundred feet apart. The electric current is supplied by the ordinary power dynamo. The plan of the invention is to elevate the walks above the surface of the street after the fashion of the ordinary elevated railroad. The weight, however, is reduced to a minimum, and the entire structure, it is claimed, can be supported by a single series of steel posts. The stairways to the walk are placed at short intervals in the block, and an automatic fare collector at the foot of each approach does away with the regular conductor. Once upon the stationary platform extending along the entire side of the walk, the passenger can step upon the slowly moving walk, thence upon the next, and finally upon the third, which, according to the present calculation, will move constantly at the rate of nine miles an hour. The sample walk now in operation at the World's Fair grounds is 900 feet in length and extends in a circle. It has been built with a view to obtain a permit from the World's Fair directors for the operation of a walk 3½ miles long and extending entirely around the grounds during the fair.

LOGS CUT WITH A KNIFE.—There was exhibited recently at Greenpoint, L. I., says the New York Herald, a machine which it is thought may possibly revolutionize the lumber business. This machine cuts lumber without any waste, and there is no sawdust whatever. In cutting lumber with a saw there is a great loss which goes into sawdust. The new invention, which is called the Bradley draw-outting machine, is designed to cut thin boards and planks, and will cut in different thicknesses varying from one thirty-second of an inch to an inch. The inventor is Thomas S. Crane, and he has been at work on it for five years. The saving of lumber that this machine will effect will be very great. Mr. Lewis said that in small lumber, one-quarter and one-half inch in thickness, one-quarter of the log is lost in sawdust. Then another eighth is lost in planing, and the lumberman in preparing his lumber for use loses three-eighths of the log. This new invention will save nearly all that. The machine was recently seen for the first time. It cut cherry, ash, birch and maple in thicknesses from a sixteenth to a half inch. It is intended

to be placed in the woods and to cut the trees as soon as they are felled. Green wood is cut more easily than seasoned wood, but logs were cut up that had lain in the yard ten years. The machine weighs forty tons.

SEAMLESS STEEL TUBES are in great demand. It is said that the demand for a tube superior to any in use at the time, for the manufacture of bicycles, was the active stimulus which brought about that really important invention. Strength, combined with lightness of material, is a necessity in a first-class bicycle, so when the seamless steel tube was brought out a few years ago, combining both strength and lightness, there was an immediate demand for it. The market has been growing ever since, not only with the rapid development of the cycling trade, but in other directions. Wherever, in fact, metal tubing is required that has to withstand a great strain, and where steel can be used, the seamless tube is in growing request. It has added materially to the efficacy and applicability of hydraulic machinery; a ½-inch tube with a core of ¼-inch can be drawn in steel to withstand a pressure of 1000 pounds on the square inch. It is now being used largely for boilers instead of copper tubing, and of course costs very much less, while its life is as long, and when made of best material, it is more reliable than ordinary copper boiler tubes. The English Government is using a large quantity in the making of search lights. In fact, the directions in which such tubing, with its superiority in weight, strength and finish, may be used are endless. Success in the manufacture of seamless steel tubing depends on two factors. The first is the employment of the very finest steel procurable, steel which is thoroughly homogeneous, and which has a high ductility and tenacity, and the machinery must be of enormous power, and constructed with the view to draw the metal with perfect truth and steadiness.

SIMPLE YET PROFITABLE INVENTIONS.—The history and growth of inventions are subjects in which all are interested. The difficulties and rebuffs which inventors have had to undergo in the perfecting of their ideas, their perseverance and ultimate success, form most interesting reading. Vast sums of money are brought in by apparently simple inventions requiring no great mechanical knowledge. The accounts of these read more like the wildest fiction than simple fact, and are sufficient to make the least covetous among us yellow with jealousy. The stylographic pen brought in \$200,000 a year; the india rubber tip to pencils \$100,000; metal plates for protecting the soles and heels of boots brought in \$1,250,000 in all; the roller skate \$1,000,000. A clergyman realized \$2000 a week by the invention of a toy; another toy, the return ball (a wooden ball with a piece of elastic attached) brought in an annual income of \$50,000; the "Dancing Jim Orow" \$75,000 a year. The inventor of a copper cap for children's boots was able to leave his heir \$2,000,000; whilst Singer, of sewing machine fame, left at his death nearly \$15,000,000. There are however, other and wonderful things which people have thought it worth while to patent, strong in the hope of making a big fortune in the near future, only to find in so many cases that their inventions were impracticable and very often perfectly ridiculous.

A PERPETUAL MOTION MACHINE has been long sought for, and the idea of its materialization has of late years been a subject of much unbelief and ridicule. Probably the nearest point to such a thing which will ever be reached has been attained and is described in the following paragraph which we clip from an Eastern exchange: "It is not generally known that a novel motor, which appears to fulfill the conditions of perpetual motion, has been running at the United States Patent Office in Washington for many years. The inventor made the claim of perpetual motion, but it is hardly correct. Perpetual motion is said to exist in a machine that 'when once started will continue to run until worn out.' This machine operates by the power given out by the different expansion of metals under varying conditions, and is so small and carefully constructed that if there was absolutely no change in temperature of the room it would run when once started, 38 days before stopping. If it were possible to put it in some place for this length of time, as the center of the earth, where the temperature would be constant, it would stop, so that it does not fulfill the conditions of perpetual motion; but that cannot be done where the machine now is, so it has run for many years without stopping, and probably will continue to run until it wears out."

A BLACKSMITH'S TOOLS of the present day are almost identical with those used in the same trade over 300 years ago. The reason is because most of the blacksmiths work, both old and new, is now relegated to the modern machine shop. The blacksmith no longer makes his own horseshoes or nails. He buys them at the hardware store. No machinery has yet been devised for shoeing a horse, or doing scarcely any of the little odd jobs which go to the blacksmith shop. Yet the blacksmith shop is a public necessity.

A NEW LEAD-HEADED NAIL for putting on corrugated roofs has made its appearance in the London markets. The head flattens under the blow of the hammer and thus prevents leaking.

SCIENTIFIC PROGRESS.

The Electrical Atom?

Possibilities Connected With the Future of Electricity.

At a recent dinner of the Institute of Electrical Engineers, held in London, the well-known scientist, Prof. Wm. Crookes, in the course of some remarks, is reported to have spoken as follows:

We have happily outgrown the preposterous notion that research in any department of science is mere waste of time. It is now generally admitted that pure science, irrespective of practical applications, benefits both the investigator himself and greatly enriches the community. "It lessens him that gives and him that takes." Between the frog's leg quivering on Galvani's work-table and the successful telegraph or telephone, there exists a direct filiation. Without the one we could not have the other.

We know little as yet concerning the mighty agency of electricity. "Substantialists" tell us it is a kind of matter. Others view it, not as matter, but as a form of energy. Others, again, reject both these views. Prof. Lodge considers it "a form, or rather a mode of manifestation, of the ether." Prof. Nikola Tesla demurs to the view of Prof. Lodge, but thinks that "nothing stands in the way of our calling electricity ether associated with matter, or bound ether." High authorities cannot even yet agree, whether we have one electricity or two opposite electricities. The only way to tackle the difficulty is to persevere in experiment and observation. If we never learn what electricity is, if, like life or like matter, it should remain an unknown quantity, we shall assuredly discover more about its attributes and its functions.

The light which the study of electricity throws upon a variety of chemical phenomena—witnessed alike in our little laboratories and in the vast laboratories of the earth and the sun—cannot be overlooked. The old electrochemical theory of Berzelius is superseded, and a new and wider theory is opening out. The facts of electrolysis are by no means either completely detected or coordinated. They point to the great probability that electricity is atomic; that an electrical atom is as definite a quantity as a chemical atom. The electrical attraction between two chemical atoms, being a trillion times greater than gravitational attraction, is probably the force with which chemistry is most deeply concerned.

It has been computed that, in a single cubic foot of the ether which fills all space, there are locked up 10,000 foot tons of energy which have hitherto escaped notice. To unlock this boundless store and subdue it to the service of man is a task which awaits the electrician of the future. The latest researches give well-founded hopes that this vast storehouse of power is not hopelessly inaccessible. Up to the present time, we have been acquainted with only a very narrow range of ethereal vibrations, from extreme red on the one side to ultra violet on the other—say from three ten-millionths of a millimeter to eight ten-millionths of a millimeter. Within this comparatively limited range of ethereal vibrations, and the equally narrow range of sound vibrations, we have been hitherto limited to receive and communicate all the knowledge which we share with other rational beings. Whether vibrations of the ether, slower than those which affect us as light, may not be constantly at work around us, we have until lately never seriously inquired. But the researches of Lodge in England, and Hertz in Germany, give us an almost infinite range of ethereal vibrations or electrical rays, from wave lengths of thousands of miles down to a few feet. Here is unfolded to us a new and astonishing universe—one which it is hard to conceive should be powerless to transmit and impart intelligence.

Experimentalists are reducing the wave lengths of the electrical rays. With every diminution in size of the apparatus the wave lengths get shorter, and could we construct Leyden jars of molecular dimensions the rays might fall within the narrow limits of visibility. We do not yet know how the molecule could be got to act as a Leyden jar, yet it is not improbable that the discontinuous phosphorescent light emitted from certain of the rare earths, when excited by a high tension current in a high vacuum, is really an artificial production of these electrical rays, sufficiently short to affect our organs of sight. If such a light could be produced more easily and more regularly, it would be far more economical than light from a flame or from the arc, as very little of the energy in play is expended in the form of heat rays. Of such production of light, nature supplies us with examples in the glow-worm and the fireflies. Their light, though sufficiently energetic to be seen at a considerable distance, is accompanied by no liberation of heat capable of detection by our most delicate instruments.

By means of currents alternating with very high frequency, Prof. Nikola Tesla has succeeded in passing by induction through the glass of a lamp energy sufficient to keep a filament in a state of incandescence without the use of connecting wires. He has even lighted a room by producing in it such a condition that an illuminating appliance may be placed anywhere and lighted without being electrically connected with anything. He has produced

the required condition by creating in the room a powerful electrostatic field alternating very rapidly. He suspends two sheets of metal, each connected with one of the terminals of the coil. If an exhausted tube is carried anywhere between these sheets, or placed anywhere, it remains always luminous.

The extent to which this method of illumination may be practically available, experiments alone can decide. In any case, our insight into the possibilities of static electricity has been extended, and the ordinary electric machine will cease to be regarded as a mere toy.

Alternating currents have at the best a rather doubtful reputation, but it follows from Tesla's researches that as the rapidity of the alternation increases they become not more dangerous, but less so. It further appears that a true flame can now be produced without chemical aid—a flame which yields light and heat without the consumption of material and without any chemical process. To this end we require improved methods for producing excessively frequent alternations and enormous potentials. Shall we be able to obtain these by tapping the ether? If so, we may view the prospective exhaustion of our coal fields with indifference. We shall at once solve the smoke question, and thus dissolve all possible coal rings.

Electricity seems destined to annex the whole field not merely of optics, but probably also of thermotics.

Rays of light will not pass through a wall, nor, as we know only too well, through a dense fog. But electrical rays of a foot or two wave length of which we have spoken will easily pierce such media, which for them will be transparent.

Another tempting field for research, scarcely yet attacked by pioneers, awaits exploration. I allude to the mutual action of electricity and life. No sound man of science endorses the assertion that "electricity is life," nor can we even venture to speak of life as one of the varieties or manifestations of energy. Nevertheless, electricity has an important influence upon vital phenomena, and in turn set in action by the living being—animal or vegetable. We have electric fishes—one of them the prototype of the torpedo of modern warfare. There is the electric eel which used to be met with in gardens and roads about Hornsey Rise, there is also an electric centipede. In the study of such facts and such relations the scientific electrician has before him an almost infinite field of inquiry.

The slower vibrations to which I have referred reveal the bewildering possibility of telegraphy without wires, posts, cables, or any of our present costly appliances. It is vain to attempt to picture the marvels of the future. Progress, as Dean Swift observed, may be too fast for endurance. Sufficient for this generation are the wonders thereof.

THE HUMAN BREATH will not remove mountains, but it has power sufficient to raise objects which have considerable weight. It will not scatter a regiment of soldiers, nor uproot trees as the fables sometimes tell us with pictorial illustrations. Yet it contains a surprising amount of leverage, which is evidenced by the long report which a paper bag filled with the breath will produce when smashed between the hands. The following experiment demonstrates the elementary power of the human breath still more forcibly: Take a large bag of good, heavy paper, lay it on the table and cover the closed end of it with several books—a Webster Unabridged and a family Bible, for instance—then blow into the bag, filling or inflating it with air, and you will soon see that it will overthrow the books, i. e., remove a small mountain.

A NEW GLASS.—Herren Max Kahler and Martini of Berlin have invented a new kind of glass, the composition of which corresponds to the atomic weight proportions

This glass is excellently adapted, on account of its high resisting powers, to the manufacture of chemical utensils. Vessels made of it do not, it is stated, contract mold, even when left standing for months, evince no inclination to harbor dust, and possess high powers of resistance against water and diluted acids. Drinking glasses, cooking jars, retorts, pipes, chemical burettes and pipettes are among the articles produced by the firm mentioned from the new vitreous substance.

THE GEOGRAPHICAL SOCIETY of the Pacific Coast presents very encouraging evidence of prosperity. This success is largely due to the efforts of its Secretary, Col. Grant. It has reached a very healthy financial standing, and will soon file articles of incorporation and take a permanent stand among the many other institutions in this city which are engaged in the promotion of scientific work and study.

EXTRACTING COPPER BY ELECTRICITY.—An English exchange says that Messrs. Siemens and Halske are experimenting with much encouragement upon a process of extracting copper from the ore by a new electrolytic method. The whole process lasts barely ten hours, and the loss is scarcely one-half per cent, so that even the poorest ore can be rendered remunerative.

DOUBLE BELTS.—One or more belts running independently on the top of another will add much to the transmission of power.

ELECTRICITY.

Electricity in Coal Mines.

The annual report of R. M. Hascittine, Chief Inspector of Mines for Ohio, recently published, devotes considerable space to the consideration of electric power as used in the several coal mines which have adopted it. It contains a very elaborate table, giving a statement of the total electric horse power absorbed by the motor while making a cut, the amount lost in the motor and machine, while running light with the feed on and with it off; the quantity lost in motor and machine while backing out of the cut just made; the net electrical horse power required to make the cut; the time occupied in making the cut, in and out; the horse-power required to undercut one square foot in one minute, the speed of armature, etc. There are 22 headings in all in the report, making it very full and elaborate. He made 41 tests. There are now a very large number of coal mines in this country employing electricity for various purposes. One trouble in this use of electricity appears to be a disinclination on the part of mine operators to either allow a sufficient quantity of copper put into the line, for future requirements, when the plant is first laid out, or to sufficiently reinforce it when required because of the increase in distance from the dynamo, or in the number of machines working. A great loss of power results from this neglect. In regard to motors, a correspondent of the *Electrical World* says: It is absolutely necessary that they be the lightest possible, and very low, the width and length also being quite limited. Mine work is the severest test to which electric power can be applied; it is worse than street railroad work.

Electric machinery for coal mines must be so made that it can stand anything, comparatively, in the way of hard work and abuse. These qualities and light weight are not consistent.

Electricity in the Dunsmuir Coal Mines.

The *Vancouver World* holds that electricity is likely to work a wonderful change in the industry of coal mining. It is believed that a great deal of the danger to life which now surrounds mining in the bowels of the earth will soon be minimized by the use of electricity instead of powders or explosives. Already the Messrs. Dunsmuir of San Francisco, at their Union mines in Comox are utilizing electricity, and so satisfactory have the experiments proved that it is their intention to introduce the new system into all their pits. Since they began to use electricity the output of their mines at the Lake, in Comox, has already been doubled. The coal brought to the surface now averages 500 tons per day, and it is pronounced by experts to be a first-class article. Four pits are being worked. It is expected that the present output will be largely increased shortly, as a couple more electric machines and motors are to be introduced. The ease and facility with which it can be conveyed, the safety with which it can be used, demonstrates the fact that electricity is the best and most economical power yet known, which can be used in coal mines.

Electric Haulage in Mines

Perhaps one of the most important applications of electricity to mining is that of haulage, which is already largely used in England, and is fast being introduced in the mines in this country. In the system employed in the English collieries, the locomotive does not depend for grip on its own weight, but gets a direct pull on a cable lying between the rails, parallel to the road, and fixed at either end. This cable passes over a sprocket wheel on the locomotive or trolley, and is driven through suitable gearing by an electric motor. The motor is supplied with energy from a bare copper wire arranged on the roof or the side of the road. It is needless to say that such a trolley is only applicable to roads free from gas. The chief advantage of the system lies in the light weight of the trolley in proportion to the heavy tractive effort it can exert. It will be principally used as an auxiliary power on short steep lengths of otherwise fairly level roads, where horses are generally used, and will be found in many cases to be a great saving in horse flesh.

The first installation of electric mining machinery in the South Wales coal fields has recently been made by Messrs. Orompton & Co. of Chelmsford, England. It consists of an electrical haulage plant designed to replace 27 horses and many handlers and door-boys, and to enable the output of the colliery to be increased by 100 tons per day. The winding gear adopted in this plant is of the novel form employed in the main and tail rope system. The motor is placed horizontally at one end of a wrought-iron frame, which forms the bed for the winding drum and spur wheel. The drum-shaft, which is of steel, is driven from a countershaft by means of spur gearing, and the motor drives the countershaft by means of a six one-inch ropes. This plant will haul coal from three different parts of the pit, and although these are not at the present far from the motor, it is expected that coal will have to be dealt with nearly a mile distant.

The Electric Miners' Safety Lamp

Bids fair to become a most perfect success. It will not only by its brighter glow give additional facility for work, but it will also introduce the new and most important factor of safety. The ideal electric safety lamp must be self-con-

tained, light in weight, simple in construction, durable and not too expensive. Where the light is most required is where the miner is at work, and as he is constantly shifting his position, it is essential that he should have a portable light. From time to time attempts have been made to produce such a light as is actually needed. A large number have been presented, but they have been generally found too heavy for convenient use. A good miner's lamp must be of simple and solid construction, as light as possible, and easy to maintain and recharge. It should yield a constant light of one or one and a half candle power for not less than eight hours, and it should be cheap. The results of experiments thus far certainly show a marked advance in the construction of electric safety lamps, and it is to be sincerely hoped that the day is not far distant when the present oil lamps will be used only for testing purposes, and a cheap, practical and convenient incandescent lamp will be used for working.

Electricity in Mining.

Electricity is rapidly making its way into the mine, where it is taking the place of hand-work for cutting in coal mines, and of steam and compressed air in drilling, hauling, stamping, pumping, etc., in all kinds of mines. In fact, it bids fair to work a great revolution in mining industry everywhere. In nearly every mining camp there is an abundance of water power, which, by means of electricity, can be economically carried to any point when it may be needed. The combination of water power and the electric motor is fast introducing a most economical factor into mining. The recent improvements in the mode of transmitting power by electricity are being everywhere watched with much interest, and especially by mine owners.

Electricity in the Colorado Mines.

According to the *Denver Republican*, electricity is already employed in many of the mines of Colorado. In the Telluride district, the Gold King stamp-mill is being successfully operated by electricity generated 2½ miles distant. This is the pioneer enterprise in that district. Several other mine owners there have been prompt to notice the economy of the new system and are making preparations to introduce it. The Belmont Company will soon convey to its mill the water power which is abundant in the valley three miles below, and many others will follow at an early day.

The *Republican* says: "The saving to the mine owners and the increase in profits which will accrue to owners of mines high up the mountain or away from convenient water power can readily be seen. Mills can now be built at the mines and the concentrates rather than the ores conveyed to the valley below. Mills that have been forced to burn wood or coal, can, through this method, operate more economically, and the many low-grade properties to which the expense of power has been a bar to operation can be worked at a profit. It is a step forward in mining, and when thoroughly understood and put into common use will add millions to the output of Colorado mines."

In Montana Also

Extensive preparations are being made to utilize, for mining purposes, water power now running to waste. According to the *Mining Journal*, large preparations are being made to utilize the Flint Creek Falls, by the electrical transmission of the power there to be developed, to various points in that vicinity. Works that will cost not less than \$100,000 are being erected to convey this power to Philipsburg, seven miles distant, and to other localities. The water which forms this creek issues from the ground a short distance above, in warm springs, and will not cool enough to freeze in the distance from the springs to the water-wheels, a great advantage in that cold region. The water-wheels employed will be of the Pelton type and ten in number. The power will be transmitted over ten heavy copper wires. This power will be used at Granite, Anaconda, Ramsey, Philipsburg and possibly even to Butte. The transmission to Anaconda will be 17 miles, where 80 per cent of the power sent out will be utilized; 90 per cent will be delivered at the nearer localities named. Butte will be the most distant locality, where only 65 per cent will be realized. When these works are in operation, it is expected that the copper from the Anaconda mine will be received at the mine, instead of being sent away, as is now done. An experimental electric refinery has already been put in operation at the mine, which is said to have proved a success.

The dam for impounding the water has already been completed. It is of stone and constructed in a most permanent manner. The entire water works will be completed by next spring, and when completed, will, it is said, be more extensive than any other of the kind in America.

The Electric Mining Percussion Drill.

One of Edison's late inventions, is just now attracting much attention among miners. It is said to bore into the hardest granite, at the rate of three inches per minute, and requires comparatively little power to operate it. It can be worked anywhere within three miles of the dynamo, which drives it. Another form of this drill is intended for prospecting work—a core drill. It will bore 150 feet into the earth, and bring up samples of everything through which it passes.

We understand that the first electric mining

drill ever ordered for California arrived in Shasta from the East a short time ago, consigned to the Gladstone Mining Co., whose property is situated on Kline gulch, in the French Gulch mining district. In addition to drills, the Edison Co. also manufactures electric hoists, electric fans and electric pumps, showing that Edison has turned his attention in earnest to mining work, and many are expecting marvelous results from this branch of electricity in the near future.

GOOD HEALTH.

Health of the State.

The November circular of the State Board of Health says that there were 1099 deaths in California during the past month. Among other things, the circular says:

Mortality reports from 109 cities, towns, villages and localities, having an aggregate population of 739,577, show the total number of deaths from all causes in November to have been 1099, making a death rate of 17.64 per 1000 for the year.

There were 178 deaths due to consumption, acute pneumonia 76, acute bronchitis 39, congestion of the lungs 6, diarrhea and dysentery 18, cholera infantum 44, other diseases of the stomach and bowels 46, diphtheria 35, croup 25, scarlatina 5, measles 2, whooping cough 4, typhoid fever 37, malarial fever 5, cerebro-spinal fever 4, cancer 45, heart diseases 83, alcoholism 12, all other causes 471.

A mild type of scarlatina prevailed quite generally throughout the State, there being but five fatalities reported. Whooping-cough has been reported as epidemic in several localities. Diseases of the respiratory organs have been very numerous; also diseases of the stomach and bowels. These may, in the majority of cases, be attributed to the quite general prevalence of la grippe, 449 cases of which were reported. It was reported as epidemic in 15 localities, where the number of cases were not given. It is reported as being very frequently associated with bronchitis and pneumonia. Rheumatism and neuralgia have been quite generally prevalent.

No cases of smallpox have been known to exist in the State for several months, and the entire United States has been quite free from this dreaded malady during the year. The Province of Quebec has, however, had 135 cases, all arising from one person that started the contagion. During November, it has been reported in New Jersey, Pennsylvania, Ohio, Tennessee and Texas. It will doubtless be controlled as far as practicable, but all efforts in that direction have in the past proven of no avail where unvaccinated people have been exposed to the disease. It is quite as likely to leap across the continent as to leap from Quebec to Texas, and this likelihood should be a sufficient warning for those who are unprotected to be vaccinated without delay. There should also be a more strict compliance with the law denying admittance to unvaccinated children in the public schools. This should be done without exciting unnecessary alarm, but the necessity for such action should be generally understood, and be insisted upon, especially in the schools.

TO PREVENT CONSUMPTION.—At a time when so much is said about Koch's consumption cure, it may be worth while to call attention to the remarks of Dr. G. W. Hamilton at a late meeting of the British Association. He said that consumption was a disease of civilization, produced by causes which reduced the standard breathing capacity below a certain level. To prevent this disease, it is necessary to use the body to the extent its strength demanded, and to see that the work it had to perform was carried on under conditions favorable to the body. It was also desirable so to arrange habits and surroundings that their tendency as a whole should be to develop the lungs. Close and badly ventilated or heated rooms, occupations which involve stooping and cramped positions, corsets, tight-fitting clothes, should be avoided; "nipping" should also be prohibited; as much time as possible should be spent in active exercise in the open air; bedrooms should be well ventilated; wool should be worn next the skin; the body should be held erect; deep inspirations in breathing should be taken through the nose, and the cultivation of all kinds of athletic exercise should be encouraged; but above all, he considered a great deal depended on prompt and early treatment of the victims of consumption.—*New York Ledger*.

THE GRIP is growing more serious in its ravage throughout Germany. The seventeen hundred patients occupying one whole wing of the great Charity Hospital at Berlin are practically all suffering from the malady. One hundred cadets in the military school at Coslin, and a large proportion of the seamen of the Baltic squadron, are similarly afflicted. It is raging in many parts of the United Kingdom and increasing in severity. From Plymouth comes the announcement of the death of Major-General Pedler, who died after a short illness. The epidemic seems also to be spreading throughout the East, though it is less virulent than in Europe. In this State it has not taken the form of an epidemic. Hollister seems to be an exception, in which town some 400 cases have been reported—many of a serious nature. One prominent citizen has died from its effects.

USEFUL INFORMATION.

HOW TO PRESERVE POTATOES.—A prize of 1000 francs was not long ago offered by a French association for a method of keeping potatoes and other vegetables. Some insulating substance, such as wood ashes, sawdust or rye straw, with sand, was used by four or five of the competitors. The plan of M. Schrihaux, who gained the prize, is to put the potatoes for ten hours in a 1½ to 2 per cent. solution of commercial sulphuric acid, when, after being thoroughly dried, they will keep without alteration more than a year. The same solution may be used many times. The acid penetrates the eyes to the depth of about one-fortieth of an inch, which serves to destroy their sprouting power; it does not have any appreciable effect upon the skin of the potatoes; but of course potatoes so treated are worthless for planting. A barrel or tank of any kind will do for the treatment. The acid is so dilute it does not affect the wood. Chemical analysis shows that potatoes treated by this process are as nutritious and healthful after eighteen months as when freshly dug.

TO FACILITATE ROPE CLIMBING.—A device recently patented by a French inventor is designed to facilitate rope climbing, while at the same time, permitting the climber to have free use of his hands. The apparatus consists of two boards, joined by a strong hinge, with a hole passing through both the hinge and the boards. The extremities of the boards are provided with straps, which can be fastened to the feet of the man using the device. The method of climbing by this apparatus is simple. When the feet are attached to the boards are lifted, the rope is free, but the moment the feet are pressed down on the two boards, the rope is firmly gripped. It is necessary, therefore, only to lift the body by both hands as far as possible, and then it can be held by the hinged clamps until another lift is made. By the use of a belt to hold the body close to the rope, the hands may be left free. This device is designed especially for the use of firemen and painters, also to serve as a fire escape.

THE WORLD'S HONEY PRODUCERS.—The largest beekeeper in the world is Mr. Harrison of this State, who has 6000 hives, producing 200,000 pounds of honey yearly. In Greece there are 30,000 hives, producing 3,000,000 pounds of honey; in Denmark 80,000, producing 2,000,000; in Russia 110,000, producing the same; in Belgium 200,000, producing 5,000,000; in Holland 240,000, producing 6,000,000; in France 950,000, producing 23,000,000; in Germany 1,450,000 and in Austria 1,550,000, each producing 40,000,000 pounds of honey. But in the United States there are 2,900,000 hives, belonging to 70,000 beekeepers, and producing 62,000,000 pounds of honey yearly.—*Californian*.

THE MOST WONDERFUL ARTESIAN WELL, perhaps, in the world, is found in Huron, North Dakota. It throws up water to the height of about 100 feet, and the amount is estimated at from 8000 to 10,000 gallons per minute. Even at the lowest figures, enough water is ejected to furnish every man woman and child in the State of North Dakota with at least four gallons of water every four hours. As to the pressure, that has not yet been ascertained, but from tests already made, it is known to be considerably more than 200 pounds to the square inch. With a fair test it is likely to reach 228 pounds.

TELEGRAPH TO THE SANDWICH ISLANDS.—There is a good prospect of a submarine telegraph cable from the Pacific Coast to the Hawaiian Islands. The first half of the survey shows that no great difficulty will be encountered in laying the cable over the 850 miles of ocean bed that has thus far been sounded. If the western half of the route offers no greater obstacles, and there is no reason to believe that it will, it is likely that the United States and the Hawaiian Governments will grant concessions, which will insure the desired communications, for which the Sandwich Islanders are especially anxious.

AN INGENUOUS INVENTION is an orange peeler that removes the coat without cutting the inner skin. It is claimed that 1000 oranges may be peeled without soiling finger or glove, or losing a drop of juice. The peeler is a piece of wire, nickel-plated, very much in the shape of a button-hook, but with a tiny blade let into the inner bend of the hook. When the point of the hook is drawn into the fruit it slides between the pulp and the peel without danger of entering either, while the blade divides the peel easily and rapidly, after which it may be removed without trouble.

AN AUTOMATIC RAILROAD GATE has been devised which is designed to obviate the necessity of keeping a watchman to close and open gates at railroad crossings, such gates being, with this construction, closed and opened by a train passing in either direction. The device for opening and shutting the gate is said to be very simple and reliable in its action.

A BIG BEAN PATCH.—The Lima bean ranch of Dixie Thompson, in Ventura county, is said to be the largest in the world, 2200 acres being planted to beans. The crop this year was about 103 carloads.

Passing Events.

This number of the PRESS closes the volume and the year. We hope to have in the coming year not only all our old readers but many new ones as well. This is a good time for renewal of subscriptions, by the way. While you are making good resolutions for the new year, make one to pay for your paper promptly in advance.

Another one of those annoying rulings by the Department has been made by which a miner is compelled to show valuable mineral, whether he has reached it or not. Both California and Montana will fight this matter in Congress this session and try and bring the Department to their senses.

In the different counties of the State, miners' meetings are being held and delegates are being selected for the State Mining Convention, to be held in this city January 20th. San Francisco will have the largest delegation—60—and these will be appointed this week. The miners are in earnest, and the press of the State is now giving the subject attention.

WM. HAM HALL, consulting engineer, has moved into new offices in the new Mercantile Library building, 530 Golden Gate avenue.

Close of the Volume.

The MINING AND SCIENTIFIC PRESS, the oldest mining journal in the United States, closes Volume LXIII with this number. It has kept abreast of the times in mining, metallurgical and mechanical improvements, and brought to the attention of its readers such things as would be of advantage to them in their business. The wide range of subjects treated, is indicated by the full index on the last page. Among other things, it will be noticed that the electrical field is rapidly growing and that that subject has received special attention. In relation to mining, the most recent electrical appliances have been illustrated and described in this volume. As fast as anything of interest in this line comes to the front, the PRESS presents it to its readers.

The current mining news from a wide area has been given weekly in a condensed form, enabling the reader to know at a glance what is going on in the various camps. The fields of industrial and mechanical progress, engineering and kindred topics have been searched for news and information of practical value to the progressive man. Our readers familiar with the usefulness of the PRESS would assist us by calling the attention of others to its merits. Mining men especially ought not to be without the paper which represents their interest on the Pacific Coast. We hope to still further improve the paper the coming year, and can assure our patrons that no efforts will be spared in making the PRESS a welcome visitor to mine, cabin and workshop.

San Francisco Miners' Meeting.

On Tuesday afternoon a number of gentlemen interested in mining met at the State Mining Boreau in this city, for the purpose of organizing and electing delegates to the State Miners' Convention which meets next month. Among those present were Ross E. Browne, W. A. Luckhardt, Chas. Hoffman, Wm. Ireland, Jr., T. R. Churoh, Chas. G. Yale, Judson Wheeler, Abraham Breese, E. Wheaton, S. J. Hendy, J. T. McCall, J. O. Whitney, S. E. Holcombe, E. Charron, Ferd. Formahs, Felix Chappelle, W. Ang. Knapp, R. McMurray, J. Z. Davis, Phil. Dedelsheimer and W. C. Ralston.

The meeting was called to order by Chas. G. Yale (of the MINING AND SCIENTIFIC PRESS), who is a member of the Executive Committee of the Placer County Mining Association. He stated that in accordance with the call issued at Auburn this meeting had been called to select delegates. It was not desired that any speeches or arguments be made. The subject was well understood by all present. Copies of the call and address had been distributed, and it was only necessary to organize and let the delegates selected attend to the business.

On motion, Robt. McMurray was elected chairman, and W. C. Ralston secretary.

On motion, the resolutions adopted at Auburn were endorsed.

The call for a State Convention was read by the secretary, and a motion was also carried that a committee should be appointed to make out a list of delegates, to be submitted to the Mayor of San Francisco, he to choose the 60 representatives.

The committee appointed consisted of Chas. G. Yale, Ross E. Browne, W. C. Ralston, T. R. Church and Wm. Ireland, Jr. Chairman McMurray was, on motion, added to the committee.

The delegates will be chosen next week. A full list of suitable names is being prepared by the committee, from which the Mayor will choose the delegates to represent San Francisco.

The American District Steam Co. of Lookport, N. Y., propose to arrange a plant for the transmission of steam for power and heating purposes in this city. If the plans are carried out, some \$400,000 will be expended.

The salt works at Salton, Colorado desert, which were overflowed by the "Salton sea" have again started up, and the first carload of salt was hauled from the marsh last Saturday. The mill will soon be running.

The Senate Committee on Mines and Mining of this Congress is composed of the following gentlemen: Stewart (chairman), Jones of Nevada, Power, Warren, Felton, Bate, Call, Chilton and Irby.

Absurd Department Rulings.

Mr. Assistant Secretary Chandler is likely to hear a very loud and unpleasant buzzing about his ears shortly. The miners of this country do not intend to stand any longer the absurd rulings now prevailing in the Land and Interior Departments. Mr. Assistant Secretary Chandler and the other officials who are so entirely ignorant of mining affairs, yet have control of them, will have to abandon some of the laws they have themselves been making in favor of laws made by Congress. The matter is to be brought forcibly to the attention of Congress, and the Departments will probably receive some instructions which will change their tune.

Here is a case in point, decided on the 18th inst.:

Mr. Chandler made it clearly known to-day that where there is a contest over whether land is agricultural or mineral, valuable mineral must be produced, and mining on the theory that precious metals exist in the ground in dispute cannot be considered good evidence. The case decided was that of John Hey and seven others, forming the Dutch Ravine Tunnel Co., against Wm. Kern and Charles H. F. Werner, who had homestead and pre-emption claims respectively in the Sacramento land district, part of the land being in the ravine named. After the filings of these men had been made and about the time Kern was ready to make final proof, the mining company appeared on the ground, filed application for a mineral patent and contested the agricultural entries. A decision was given against them by the Land Commissioner and they appealed. Mr. Chandler quotes precedents showing that the burden of proof is on the contestants to show their mineral character, and they were required to show by a preponderance of testimony that the land is more valuable for mining than for agricultural purposes as a present fact, and that it must be shown as a present fact that the lands are mineral, and not from the theory that the lands may hereafter produce it. The evidence showed the uncertainties and rainbow-chasing features of mining as it is too often carried on.

Specklog of the mining company, Mr. Chandler says: "They have run a tunnel into the hillsides several hundred feet through the rock in an attempt to reach an ancient river channel which they supposed to exist, and which they think would yield gold-bearing gravel if they could only strike it. They have expended \$15,000 in this attempt, but they have not struck the ancient river channel."

"Mining on the theory that precious metals exist in the ground in dispute cannot be considered good evidence; valuable mineral must be produced," says Mr. Assistant Secretary Chandler.

If Mr. Chandler, in his wisdom, will show the miners of California how to produce the valuable mineral from under the lava-capped divides of this State, without first running their tunnels, he will confer a great boon. He talks wisely about the "uncertainties and rainbow-chasing features of mining as it is too often carried on."

The fact is, Mr. Chandler does not know what he is talking about. His position is absurd in the last degree. We have known about the "dead rivers" under the lava-capped divides in California for the last 30 years and more, but that knowledge has not yet got as far as Washington. They do not know about or understand the drift-mining proposition. In fact, the law does not yet recognize it.

To open such mines requires often years of time and hundreds of thousands of dollars. Does Mr. Chandler suppose the miners are such asses as to spend their time and money on a place where there is no hope of reward? Does he not suppose that if they could get at the gold without this expense, they would do it at once?

What business has a mere ephemeral Secretary or Assistant Secretary to require valuable mineral to be produced from the ground in question. The U. S. laws do not require it. The Secretary or Assistant does not require the agricultural claimant to produce a crop or part of a crop. He asks the miner to show his gold actually; he does not ask the farmer to show a cash crop or turnip. As to the land being mineral or agricultural, the value is equally prospective in each case. The theory that precious metals are in the ground is as good as that theory which supposes agricultural products may result from cultivation. The miner knows his business. He does not burrow into a mountain, at vast expenditure of time and money, unless he expects something for his labor. He is a much better judge of the matter than Mr. Secretary in his armchair at Washington.

One loses patience when seeing the mineral domain of the country passing from the prospectors' hands into that of railroad companies and farmers for whom neither the people nor the laws ever intended it.

It is true the Assistant Secretary quotes precedents for his action, but the precedents are the rulings of himself and equally ignorant predecessors in office. They are not based on any law of Congress.

The attention of the present Congress will be called to these misapplications of the law. The Mining Act of May 10, 1872, has been almost entirely set aside by a lot of officials who know nothing of mines or mining methods. The evil has now become so great that the miners of the country have lost patience and will make a united fight for their rights. It is almost impossible to obtain patent for mineral land, and yearly large tracts of the mineral domain are removed from entry. It is time this should stop, and it shortly will be stopped. Congress must take the matter in hand, and bring the department up "with a round turn."

Preparing for the Mining Convention.

Already twenty-two counties of the State have been heard from as preparing for the coming Miners' Convention in this city. In several counties meetings have been held by the miners, and delegates have been selected. In others the meetings have been called and the men will be chosen in due time. The subject has received attention generally from the press of the State and the people are ready to hear what the miners have to say.

There is one mistaken idea, however, in this connection, which many persons have. It is not to be a hydraulic mining convention, but one in which quartz, drift, river and hydraulic miners participate. The quartz and drift miners want to bring to the attention of Congress the alienation of the mineral domain by agricultural and railroad claimants; and the unjust rulings of the Departments which are practically nullifying the mining laws of the country. The hydraulic miners want Congress to pay heed to the report of the U. S. Engineers and want some kind of relief so they can work their mines. They recognize that injury has been done to the farming interests of a section of the State by their debris, and they now want permission to build the dams recommended by the U. S. Commission so the debris can be held back, and they can work their mines again. These, briefly, are the subjects which will be considered by the miners at their convention on January 20th.

ACADEMY OF SCIENCES.—At the meeting of the Academy on Monday evening the committee on nominations recommended the following as the regular ticket for the annual election of officers: President, H. W. Harkness; first vice-president, H. H. Behr; second vice-president, J. G. Cooper; recording secretary, J. O. Schupham; corresponding secretary, Frederik Gutzkow; librarian, Carlos Troyer; director of the museum, J. Z. Davis; trustees, C. F. Crocker, W. C. Burnett, B. E. Hayes, E. J. Moler, George C. Perkins and Adolph Soto. All the persons recommended by the committee are the present incumbents, with the exception of Mr. Suto, whose name is substituted in place of that of Irving M. Scott, who declined to serve on account of his inability to be present in the city. The election of officers will be held on Monday, January 4th, the polls to be open from 9 A. M. to 6 P. M. W. E. Bryant and J. W. Hinckley were appointed judges, and C. I. Keeler and A. Madre, inspectors of election.

ANTI-DEBRIS MEETING.—A meeting of the Advisory Board of the Anti-Debris Association was held at Marysville on Monday. The situation with regard to hydraulic mining and what the coming Miners' Convention is likely to bring forth was thoroughly canvassed, and a resolution was adopted asking that the River Improvement Convention, with an increased delegation, be convened again at an early date, either in Sacramento or San Francisco. The Supervisors of the valley counties have been asked to increase their membership to the convention.

ANOTHER big strike has been made in the "Old Abe" mine, at White Oaks, N. M. The new vein is six feet wide and rich in gold.

The Water Front of San Francisco.

(Concluded from page 415.)

extended entirely around the water front from one end of the city to the other. It is intended to furnish track facilities for all railroads reaching the city, and belongs, like the rest of the water front property, to the State. No one railroad has any more right to its use than another, and those which use it pay certain fixed charges per ton and per car. It is a double-track steel road with a third rail for the accommodation of narrow-gauge cars. The locomotive is a saddle-tank switching engine of the most improved type, weighing 58 tons. It was made at the Baldwin Locomotive Works specially for this road.

A special ferry slip has been built at the foot of Lombard street for the ferry-boats carrying

The State receives \$900 a month for each of these sheds and adjoining space and sidetracks from the two narrow-gauge railroad companies now using them. There are wide platforms for handling freight, and there is plenty of room on all sides for teams, etc. Close by, on Davis street, is the platform for discharging coal. This plan shows section one of the belt road, which is all that has thus far been built. It will gradually be extended as the other work on the water front progresses. There is a paved driveway outside of the railroad tracks which goes entirely around the front. This is 80 feet wide, and is used by teams only. The roadway inside the tracks is also 80 feet wide.

The great grain sheds which form such an important feature of the city front, also belong to the State. They commence at the foot of Francisco street and extend along around to Stockton street. They are 2000 feet in length

points on the city front. Vessels of course pay wharfage, but it is only two cents per ton for small vessels and for large ones \$4 for the first 200 tons and three-quarters of a cent for each additional ton. Lighters pay a dockage charge of one cent per ton. Small barges pay two cents per ton and large ones the same as ocean vessels. Dockage means the charges for vessels occupying berths at the docks; tolls, the charge for merchandise passing over the wharves, and wharfage the charge for leaving merchandise on the wharves longer than the specified time.

These facts should be borne in mind, for the great grain industry of the State is put to the smallest possible burden at this port. The vessels that pay dockage are mainly British merchantmen; but the grain, etc., itself pays no charges over the wharves or in the warehouses except when stored over the time specified as above.

center of the city and near the large warehouses.

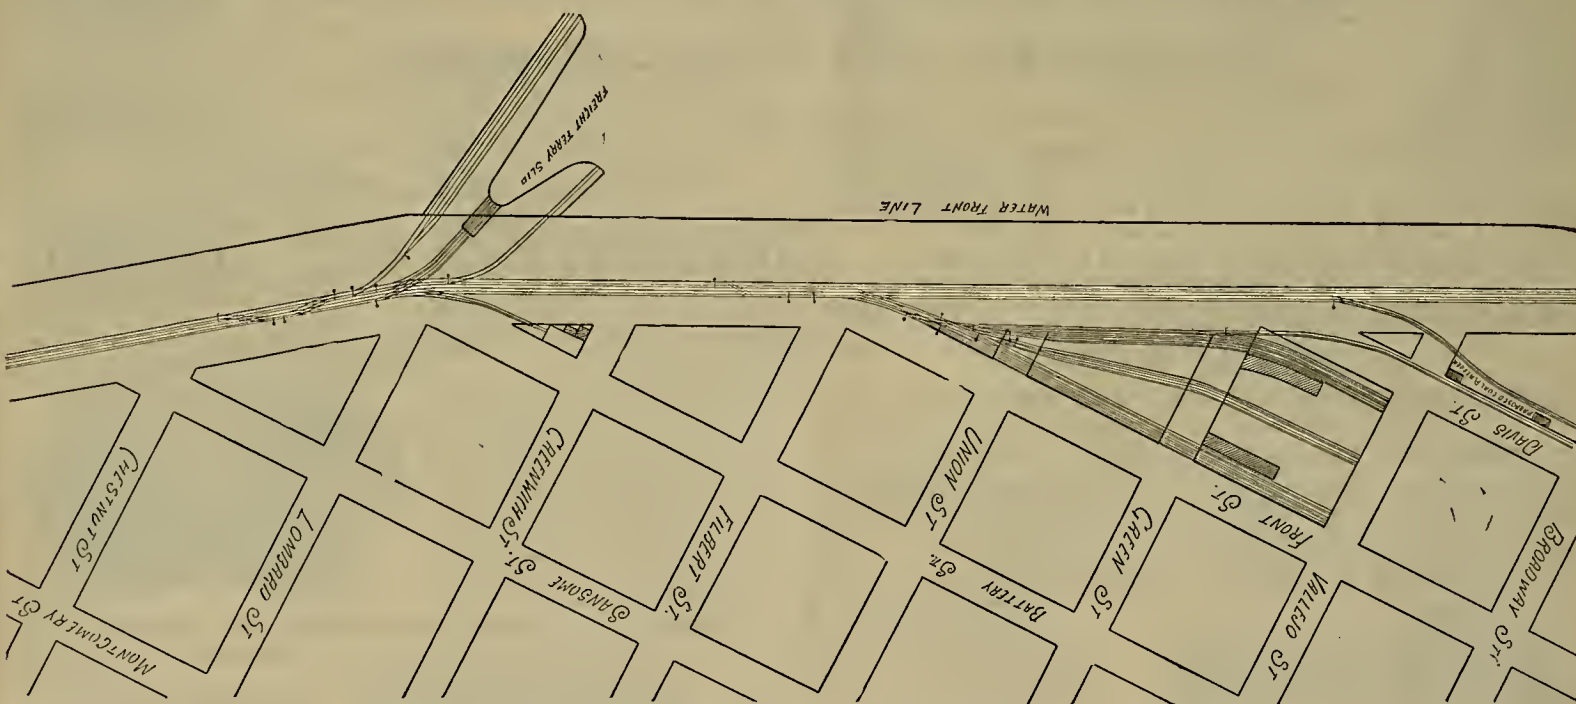

The China, Central, India, South and Dry Dock basins at the south end of the city will be retained as part of the navigable waters of the bay, and free entrance will be secured to them through the structures across their openings. It will be some years before work will be done at these large basins.

The Board of State Harbor Commissioners consists of C. T. Bassett (President), C. O. Alexander and H. W. Brown. J. J. Keegan is Secretary of the Board and Sol D. Rogers assistant. The chief engineer of the Board, under whom all the work along the water front is carried out, is Marston Manson, and his assistant is Marston Campbell.

The Belt railroad is operated under the Engineers' Department of the Commission. The principal employees are: J. J. Saxton, yard-

IDEAL TRANSVERSE SECTION OF SEA WALL, EMBANKMENT, BELT RAILROAD AND GRAIN WAREHOUSES.

PLAN OF SECTION ONE OF BELT RAILROAD ON SAN FRANCISCO WATER FRONT.

freight cars, and the tracks connect with this slip. From here the loaded cars are hauled on the tracks to the warehouses and depots, where the freight is discharged, thus saving long haulage by wagons and trucks from the freight depots of the railroad companies, which are necessarily on the outskirts of the city. The cars are handled, when leaving the freight boats, by the employees and engines of the Harbor Commissioners, the railroad companies having nothing whatever to do with the operation of the belt railroad. None of these locomotives come on this road. They bring the cars to their boats to the freight slip, and these cars are carried by State employees to the destined warehouses or freight platforms. When the cars are unloaded, they are again returned to the freight boats. Cars should also, of course, be loaded at warehouses and manufacturing and the goods shipped away, so that much expense in handling may be saved.

We have prepared a plan map showing that portion of this belt railroad thus far put in operation. The freight ferry slip or dock is shown at the foot of Lombard street. At the foot of Greenwich street, on the small triangular lot, is the roundhouse where the locomotive is kept, and where are the offices of the yardmaster, engineer, etc. Between Front, Davis, Vallejo and Green streets are the freight sheds where the cars are discharged or loaded. The approaches to these depots or sheds are paved with stone, and there are offices in the buildings for clerks, etc.

are 100 feet wide and 16 feet high on the sides. The roof is supported by trusses. There is a space of 20 feet between the outside of the shed and the edge of the wharf, where vessels may load or discharge. Inside, and along the roadway, extend the tracks of the belt railroad. The grain may be brought in cars, deposited in the warehouses, and then be placed on the ships with very little handling. These sheds will be lengthened as occasion demands. A cross section of these sheds is shown in one of the cuts given herewith.

No tolls are charged on grain, flour or breadstuffs for passing over wharves under the Harbor Commissioners' jurisdiction, but such articles are subject to the same rules and rates of wharfage as are imposed on other merchandise except on Sections 1 and 2 of the sea wall, and that is the point where the grain warehouses are situated. The term "grain" includes barley, oats, corn and rye; the term "flour" includes only the flour of wheat, and "millstuffs" includes bran, middlings, shorts and ground feed. Grain, flour, millstuffs, beans and seeds are allowed to remain in the grain sheds for five days without any charge. After that they must pay five cents per ton, and at the end of thirty days must pay ten cents per ton per day.

It will be seen by this that as far as farm products in grain, etc., are concerned the Harbor Commission does not represent a "toll-gatherer by the sea" as many people suppose, but it specially omits tolls as well as warehouse charges for a particular time and at certain

Another thing: The Harbor Commissioners have made a rule and abide by it, that "The use or keeping of intoxicating liquors on any wharf, or in any office or on any premises under the jurisdiction of the Board, is forbidden, and the violation of this order by any officer or employee of the Board will be deemed sufficient cause for the dismissal of the offender." The Board permits no saloon privileges on any property under its jurisdiction.

As to coal, thus far only a small platform has been prepared for landing and loading this, but better arrangements will be made in time. As it is, however, some 20 carloads a day are now shipped on the South Pacific Coast R. R. along the line to Santa Cruz. The coal comes direct from the steamers to the cars, and no longer has to be put in schooners and again discharged.

The San Francisco and North Pacific R. R. formerly had no place for handling its freight on the city front, but now it has one of the two depots or sheds, giving the Sonoma and Mendocino county products cheap access to the city, which they have not practically had before. The cars can now discharge directly into trucks and wagons, and the freight be delivered easily and quickly. The Southern Pacific Co. has as yet no facilities offered by the belt railroad, but its freight depot will be built on the next section. Then the handling by team from Fourth and Townsend streets can be done away with to a great extent, and goods delivered nearer the

master; Fred Barto, engineer; J. P. Cleese, fireman; and El Yale and L. E. Stinson, switchmen and brakemen. At present, the cars are brought on the freight boats and placed in position at the freight depots at night, ready to be discharged and loaded in the daytime.

We have only been able, on this occasion, to give a brief sketch of the general features of the improvements along our water front, but it will serve to give an idea of what has been done in the way of shipping facilities at the principal port of the Pacific. At some other time, it is our intention to speak more in detail of the engineering features of the work, which have been carried out under Chief Engineer Manson's direction upon instructions from the Board.

THE PALM MINE.—Work continues in the shaft of the Palmside mine in King canyon, and three shifts, working eight hours each, are deepening it as fast as possible, but the rock has been hard and progress slow. The shaft was down 160 feet, including a 20-foot slump; to this about 100 feet have been added. The work is very costly, on account of hardness of the rock, the outlay being from \$57 to \$30 per foot. A little less than 10 feet per week have lately been added to the depth of the shaft, which would be considered very slow work on rock of ordinary hardness, with three changes of miners daily.—Independent Callistogian.

NOTICE TO GOLD MINERS!

SILVER-PLATED AMALGAMATED PLATES

For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER

AT REDUCED PRICES.

Our plates are guaranteed, and by actual experience are proved, the best in weight of silver and durability. Old Mining Plates Replated, Bought, or Gold Separated. THOUSANDS OF ORDERS FILLED.

NATIONAL IRON WORKS

N. W. Corner Main and Howard Sts., San Francisco,

—MANUFACTURERS OF—

Stationary and Compound Engines, Flour, Sugar, Saw
and Quartz Mill Machinery.

AMALGAMATING MACHINES. CASTINGS AND FORGINGS Of Every Description
ALL WORK TESTED AND GUARANTEED.

IMPROVED PORTABLE HOISTING ENGINES.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers
cordially invite miners to critically
examine and pass judgment upon
this improved system of milling
and amalgamating ores in the fol-
lowing particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with
Stamps, Ball Pulverizers or and
other ore crushing machines now
before the public.

MARSHUTZ & CANTRELL.

Adamantine Shoes and Dies

—AND—

CHROME CAST STEEL

Cams, Tappets, Bosses, Roll Shells and Crusher Plates.

THESE CASTINGS ARE EXTENSIVELY USED IN ALL THE MINING STATES and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to above conditions. When ordering send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 220 Fremont St., San Francisco.

Special attention given to the purchase of Mine and Mill Supplies.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Concentrating Belt manufactured in San Francisco; we can therefore fill all orders on short notice. The length and width of these belts are the same as is used on the Froe or Triumph Concentrating Machines, but can be made of any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

SQUARE FLAX PACKING.

MANUFACTURED FROM STRICTLY FIRST-CLASS FLAX AND PURE LUBRICANTS. HAS NO SUPERIOR for all Hydraulic Work.

W. T. Y. SCHENCK, Sole Manufacturer, 222 and 224 Market Street, San Francisco, Cal.

IT HAS NO EQUAL POSITIVELY FIRE-PROOF.

Can Be Put On by Any One. Adopted by the Navy.

MAGNESIA SECTIONAL COVERING

For BOILERS, STEAM PIPES, COLD STORAGE, and all places requiring Non-Heat-Conducting Material.

Elevator, 12 Front.

House Committees.

Speaker Cripe has prepared a complete list of the House Committees. From this, we publish those of interest to our readers, as follows:

Mines and Mining—W. H. Cowles, Cooper, Peet, Campbell, Pendleton, Camblott, Arnold, Bowman, Miller, Townshend, Stevenson, Post, Hoff and Smith.

Rivers and Harbors—N. C. Banchard, Catohings, Stewart, Lester of Georgia, Clark of Alabama, Haynes, Wadock, Jones, Byrns, Henderson of Illinois, Herman, Stephen, Stone of Pennsylvania and Quackenbush.

Railroads—J. B. Riley, Latham, Lane, Brown, Ellis, Covert, Castle, Coolidge, Snodgrass, Raines, Filck, Lind, Taylor of Ohio and Orain.

Public Lands—T. C. McKee, Pendleton, Tucker, Merman, Bailey, Darmand, Searley, Stout, Pickler, Townshend, Sweet and Clarke of Wyoming.

Territories—J. A. Washington, Kilgore, Manser, Campbell, Parrett, Branch, Terry, Jerry Simpson, Donovan, Rife, Smith of Illinois, Perkins, O'Donnell and Joseph.

Railways and Canals—T. C. Catohings, Lester of Virginia, Cate, Bentley, Bietzboover, Casely, Cobb of Missouri, Halverson, Davis, Randall, Bergen, Hall and Loud.

Labor—J. C. Tarnsey, Wilcox, Dixon, McKelghan, Dugan, Bunting, Capehart, Cansey, Davis, Buchanan of New Jersey, Brosius, Haugen and Wilson of Washington.

Coinage, Weights and Measures—Bland, Charles, Tracy, Williams, Kilgore, Robinson, Pierce, Eppes, Williams of Massachusetts, McKelghan, Bartine, Taylor of Illinois, Stone of Pennsylvania and Johnson of North Dakota.

Inquiry into the records of the members of House Committee on Coinage, Weights and Measures show that, by past utterances or votes, 8 out of the 13 members of the committee have declared in favor of free coinage, while three other members are outspoken against free coinage, and a fourth is said to be unquestionably against free coinage.

The members in favor of free coinage are Bland of Missouri, Williams of Illinois, Kilgore of Texas, Robertson of Louisiana, Pierce of Tennessee, Eppes of Virginia, McKelghan of Nebraska, and Bartine of Nevada. Those opposed to free coinage are Tracey of New York, Williams of Massachusetts, Taylor of Illinois and Stone of Pennsylvania. Johnson of North Dakota was not in the last Congress, but he is thought by some to be in favor of free coinage.

The silver men are very well pleased with the Constitution of the Coinage Committee, and regard it as significant of the speaker's purpose to afford an opportunity for the passage of a free-coinage measure. Chairman Bland is the most pronounced Democratic advocate of silver in the House. The silver men regard the fact that Bartine heads the list of Republican members as another indication of the speaker's friendliness toward a liberal silver policy.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING DEC. 15, 1891.

- 465,231.—CAR COUPLING—J. T. Aabel, S. F.
465,421.—CULTIVATOR—D. E. Barton, S. F.
465,422.—SHOE FOR CULTIVATORS—D. E. Barton, S. F.
465,152.—WASHING MACHINE—J. S. Bood, Napa, Cal.
465,128.—STEAM ORE STAMP—E. W. Curtiss, Portland, Or.
464,960.—PLIABLE FLANGE PILE CASING—Edward Davis, Redondo, Cal.
465,357.—THRASHER ATTACHMENT—Robert Davis, Modesto, Cal.
465,095.—VALVE—C. I. Hall, S. F.
465,188.—MOP—Charles Moore, Visalia, Cal.
465,207.—LAWN IRRIGATOR—W. A. Russell, Los Angeles, Cal.
465,102.—ORNAMENTING WALLS, ETC.—T. Tucker, Oakland, Cal.
465,302.—HORSE COLLAR STUFFING MACHINE—W. J. Webber, S. F.

The following brief list by telegraph, for Dec. 22, will appear more complete on receipt of mail advices:

California—Jonathan R. Brought, Mojave, vehicle shaft; Sidney R. Deason, electric weather strip; Edwin T. Earl, Los Angeles, ventilator and combined ventilator and refrigerator; John R. Morse, Los Angeles, hydrocarbon burner; Jonas E. Osborne, Daggett, traction wagon-steering apparatus; James Shepherd, San Francisco, extension joint for urinals; Frank E. Tremper, San Francisco, speeding and reversing gear; Joseph S. L. Tuck, San Francisco, excavator; George A. Williams, San Diego, hair-working machine.

Oregon—Andrew Olson, Medawake, stringed musical instrument; Charles W. Tremble, Portland, steam engine; Ellis W. Naxon, Forest Grove, drier case.

Washington—Remembrance L. Kirby, Pomeroy, books. Norm.—Copies of U. S. and foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

THE WARSHIP TEXAS.—We have been received from Gano G. Kennedy a fine large photograph of the U. S. warship Texas, now being built at Norfolk Navy Yard. She will be completed in a short time.

THE Hale and Norcross suit has been continued until Jan. 4th, when the new defendant, the Nevada Mill Co., Hobart, Hayward, Jones, et al. will file their answer.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MOP.—Chas. Moore, Visalia, No. 465,188. Dated December 15, 1891. The principal use of this mop is in the cleaning of ceilings. Water is placed in a small trough forming part of the implement. Then the mop is raised by its pole until the mop-roll or cylinder comes in contact with the ceiling. The head of the mop is then moved so that the cylinder or roll will rotate, and as it rotates in the trough it takes up the water therefrom and transfers it to the ceiling. Then the mop-head is moved in the other direction, and as the cylinder or roll cannot turn in this direction (being held by ratchets) it wipes over the previously wetted surface and thus cleans it. Any drip that may fall is caught in a receptacle forming part of the implement. To dry the surface a suitable drying cloth is placed between the clamp jaws, which are bound upon it by setting up a thumb-nut, and this cloth is then wiped over the surface.

WASHING MACHINE.—J. S. Bood, Napa, No. 465,152. Dated Dec. 15, 1891. The object of this invention is to provide for a circulation of the water in the casing in such a manner that it will be driven around, under and behind the clothes, thoroughly permeating them, and by its force, producing in the mass a turning and agitation very beneficial to the cleansing process.

Two gentlemen from Scotland have closed negotiations for and secured deeds to the iron mines at Newberry, on the Atlantic and Pacific railroad, San Diego county. The purchase price was \$200,000.

JOHN DAVIES, originally the owner of the Little Onlet mine at Leadville, died at Chicago on the 20th. He had made and lost several fortunes in mining in California and Colorado, and died penniless.

To Subscribers and Readers.

AN EASY BINDER.—T. Dewey's Patent Binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable and so simple a child can use it. Price, size of Mining and Scientific Press. Rural Press, Watchman, Fraternal Publishing Co.'s journals, Harper's Weekly and Scientific American, 8c; postage 10 cents. Postpaid to subscribers of this paper, 50 cents. Send to this office for illustrated circular. Agents wanted.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

By P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulae, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is especially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated: General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulae Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulae and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water through Short Tubes and Compound Tubes; Flow of Water through Pipes; Tables of Velocities and Cubic Feet Flows for Given Full per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, \$2.00, post-paid. Sold by Dewey & Co., Publishers, 220 Market St., San Francisco.

ANNUAL MEETING.

THE REGULAR ANNUAL MEETING OF THE Stockholders of the New El Dorado Gold Mining Company, will be held at the office of the Company, No. 310 Pine Street, Rooms 15 and 17, San Francisco, California, on MONDAY, the 4th day of January, 1892, at the hour of twelve o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Saturday, January 23, 1892, at 12 o'clock P. M. J. W. FEW, Secretary. Office, No. 310 Pine Street, Rooms 15 and 17, San Francisco, California.

WADE & WADE,

Analytical Chemists and Assayers, ESTABLISHED 1857—102 SOUTH BROADWAY, LOS ANGELES, CAL. We have fitted up the best laboratory in Southern California and are prepared to make Assays and Analyses of all Metals, Minerals, Ores, Waters, Fertilizers, Etc. ASSAYING TAUGHT.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I—Gold and Silver Ores.

SECOND EDITION—PRICE \$1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes thereof by knowledge from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Refining; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Course Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well bound in cloth; 1889. Price, \$1, postpaid. Sold by DEWEY & CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc

SECOND EDITION—JUST OUT.

Price \$1.75

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhard's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Selt; Note.

One of the methods given for the Assay of Copper is new, original and exact as is also one of the processes for Zinc. The book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, \$1.75. Sold by DEWEY & CO., Publishers, No. 220 Market St., San Francisco.

Malthine M'f'g Co.

FACTORY:

Cor. Jefferson & First Sts., Oakland, Cal.

MANUFACTURERS OF

ACID, ALKALINE AND WATER-PROOF PAINTS.

Superior to anything of the kind in the market for

IRON, WOOD AND TIN.

Unequaled for Submerged Timbers. Red and Brown Paints for Roofs, Warehouses, Stables, Fences, Etc., mixed Ready for Use. Also, Sheathing Paper, Portable California Mastie Roofing, the Best in the Market for

RANCH AND CITY.

AND UNEQUALED FOR

Teredo-Proof Pile Covering.

This Company also Manufactures a Malthine Compound for

RENDERING BOOTS AND SHOES WATERPROOF.

The same is a superior article for Preserving Harness rendering it Impervious to Moisture and keeping it always pliable and soft.

Send to Factory, Jefferson and First Streets, Oakland, for Samples and Prices.

DIVIDEND NOTICE.

The German Savings and Loan Society, 526 California Street.

FOR THE HALF YEAR ENDING DECEMBER 31, 1891, a dividend has been declared at the rate of five and four-tenths (5 4/10) per cent. per annum on Term Deposits, and four and one-half (4 1/2) per cent. per annum on Ordinary Deposits, payable on and after SATURDAY, January 2, 1892. G. O. TOURNEY, Secretary.

DIVIDEND NOTICE.

SAN FRANCISCO SAVINGS UNION, 532 CALIFORNIA ST., corner Webb; branch, 1700 Market St., cor. Polk. For the half year ending with December 31, 1891, a dividend has been declared at the rate of five and four-tenths (5 4/10) per cent. per annum on term deposits, and four and one-half (4 1/2) per cent. per annum on ordinary deposits, free of taxes, payable on and after SATURDAY, January 2, 1892. LOVELL WHITE, Cashier.

INVENTORS, TAKE NOTICE!

L. PETERSON, MODEL MAKER, 258 Market St., N. E. cor. Front (up stairs), San Francisco. Experimental machinery and all kinds of models. Trial and brasswork. All communications strictly confidential.

About Obtaining Patents.

Patents are Virtually Contracts.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, in order that it may afford him complete protection for his invention during the life of his patent.

How to Procure a Patent.

To avoid all needless delay, however, and secure patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with \$15 as a first instalment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately and forwarded to the Inventor or for his signature. When he receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously presented to secure the best patent possible. (This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps.) When the patent is allowed, the inventor will be duly notified, and on sending the final Government fee of \$20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretense of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give up a case so long as there is a chance of obtaining a patent. The Agency charge, including drawings, rarely exceeds \$40, and for this we do all we can without appealing the case.

Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are more satisfactory to the Patent Office than the old cumbersome system of storing up an immense bulk of countless models.

Drawings or sketches, sufficient to illustrate the invention clearly, with a description that will enable us to make a full set of perfect drawings for the Patent Office, is all that we require. A model will answer our purpose as well, however, in cases where the inventor can more easily furnish it.

Secure a Good Patent.

The value and even the validity of a patent often depends on the character, clearness and efficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often prejudice capitalists and manufacturers against the invention, while in reality it may be of great value, and would meet with ready sale had it been skillfully, completely and artistically portrayed. In all cases prepared by us, the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken to have the invention fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

Advantages to Inventors on the Pacific Coast.

The firm of DEWEY & Co. has edited and published the MINING AND SCIENTIFIC PRESS continuously since 1850—a period of 39 years. Few agencies, who are still engaged in the business, have had so long-extended practice in patent soliciting. The members of the firm give personal attention to the applications intrusted to their care; and their familiarity with inventions and with local affairs in the Pacific States and Territories enables them to understand the wants of inventors on this coast more readily and thoroughly as we believe, than any other agents in America. Thus there is saved a great deal of the time which ordinarily, when distant agents are employed, is wasted in preliminary writing back and forth.

This happy combination of long business experience together and wide connections has placed our firm in a position unquestionably most fortunate for affording inventors prompt and reliable advice, and the best facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording just the circulation best calculated to widely inform the class of readers especially interested in the subject of his invention.

Caveats.

A caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat, is that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, which is adjudged to be novel and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from \$10 to \$20. The Government fee is \$10 additional.

To enable us to prepare caveat papers, we require only a sketch and description of the invention.

Rejected applications.

Inventors who have rejected cases (prepared either by themselves or for them by other agents) and desire to ascertain their prospects of success by further efforts are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors doing business with us will be notified of the state of their application in the Patent Office whenever it is possible for us to furnish such information.

DEWEY & CO.

ROSE'S Mechanical Drawing SELF-TAUGHT.

Fourth Edition, Thoroughly Revised and Corrected.

JUST READY.

Mechanical Drawing Self-Taught; Comprising Instructions in the Selection and Preparation of Drawing Instruments, Elementary Instruction in Practical Mechanical Drawing, together with examples in Simple Geometry and Elementary Mechanism, including Screw Threads, Gear Wheels, Mechanical Motions, Engines and Boilers. By Joshua Rose, M. E. Illustrated by 330 engravings. Fourth edition thoroughly revised and corrected. 8vo. Price.....\$4.00

BY THE SAME AUTHOR:

Modern Steam Engines. An Elementary treatise upon the Steam Engine, written in plain language for use in the workshop as well as in the drawing office, giving full explanations of the construction of Modern Steam Engines, including diagrams showing their actual operation; together with complete but simple explanations of the operations of various kinds of valves, valve motions, link motions, etc., thereby enabling the ordinary engineer to clearly understand the principles involved in their construction and use, and to plot out their movements upon the drawing board. By Joshua Rose, M. E. Illustrated by 422 engravings. In one volume, quarto, 321 pages. Price.....\$6.00

The Complete Practical Machinist. Embracing Lathe Work, Vise Work, Drills and Drilling, Taps and Dies, Hardening and Tempering, the Making and Use of Tools, Tool Grinding, Marking out Work, etc. By Joshua Rose, M. E. Illustrated by 356 engravings. Fifteenth edition thoroughly revised and in great part rewritten. 12mo. pages. Price.....\$2.50

The Slide Valve Practically Explained. Embracing Simple and Complete Practical Demonstrations of the Operation of each element in a Slide Valve Movement. By Joshua Rose, M. E. Illustrated by 35 engravings. 12mo. Price.....\$1.00

Steam Boilers. A Practical Treatise on Boiler Construction and Examination. For the use of Practical Boiler Makers, Boiler Users and Inspectors; and embracing in plain figures all the calculations necessary in Designing and Classifying Steam Boilers. By Joshua Rose, M. E. Illustrated by 73 engravings. 8vo. 250 pages. Price.....\$2.50

Illustrated Circulars, giving the full table of contents of all the above works, sent free to any one who will apply.

The above or any of our Books sent by mail, free of postage, at the publication price to any address in the world.

Our new revised Descriptive Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our Catalogue of Books on Steam and the Steam Engine, Mechanics, Machinery, and Dynamical Engineering, and other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, Dec. 24, 1891.

Business continues dull, yet merchants and others are very hopeful of more general prosperity the coming year. The only fears now expressed are that when general trade revives, a speculative mania will set in which is likely to carry the many beyond the limits of discretion. Among iron-workers there is more activity than usually obtains around the holidays, with the outlook quite promising for 1892 being a prosperous year.

The local money market is fairly easy, much easier for the closing weeks of the year than for years past. The fruit crop, wool clip, hop crop and cereal crops are about marketed and at good prices, which have contributed no little to the general ease in money.

New York advices report that in next month there will be larger disbursements for interest, dividends, etc., than ever before made within the history of the country. With the funds returned to the general reservoirs, money will be in oversupply, owing to outside requirements lessening.

Mail advices from London report that the Chancellor of the Exchequer has abandoned his project favoring the issuing of £1 notes by the Bank of England against gold and consols. This course was due to the opposition with which it met.

MEXICAN DOLLARS.—The steamer Belgic for China took out \$90,285 for Hong Kong and \$20,000 for Yokohama. The market is fairly steady at around 75 cents.

QUICKSILVER.—Receipts the past week aggregate 132 flasks locally and 250 flasks by overland railroad. The market is still quoted at \$47.50 by the combination.

SILVER.—The market has shaded off slightly, evidently due to the absence of any bull or speculative movement. Speculators on the bull side were taught a severe lesson at the time Congress passed the present silver law. There appears to be a growing impression that Congress will not be apt to pass a free-coinage bill unless it is confined to the output of American mines. Many claim that even this can not be secured, but a compromise bill passed increasing the monthly purchases. It looks as if Germany's action regarding the international conference on silver will be governed by that of England. On this subject, a press cable from Berlin says: The attitude of the Government upon the question of bimetalism continues to be one of waiting. When William Seligman, who was sent to Europe as a representative of the United States Treasury Department for the purpose of arranging an international conference, was here, sounding the Government, Chancellor von Caprivi stated that the action of Germany and England would depend upon the currency development in Washington. Herr Miquel, Imperial Minister of Finance, is a strong gold party. Secretary von Marshall, although a strong bimetalist, will only act jointly with England for a discussion of the subject.

BORAX.—The local market is steady. New York advices report a slight advance owing to a temporary scarcity.

LIME.—Receipts the past week aggregate 2483 bbls. The market is steady with a fair demand ruling.

LEAD.—The market is unchanged, both on this coast and at the East.

IRON.—The market has a strong tone. The low outward freights ruling at this port and an increasing demand are in favor of both spot and to arrive.

COPPER.—The market hangs around last week's quotations. It now looks as if 1892 is likely to see an improvement in prices, although before it comes, slightly lower ranges in values may obtain. America appears to hold the key to the situation, and it is not at all likely that the Lake Superior companies will miss an opportunity of advancing prices when it can be done with safety to their interest.

TIN.—The markets, both on this coast and at the East, are dull and heavy for pig and plate.

COAL.—Imports the past week aggregate as follows: Swansea 2179 tons, Cardiff 1980, Tacoma 5750, Departure Bay 5534, Coos Bay 750, Seattle 5515, Nantaimo 8803, Comox 4150. Total 34,661. A feature of the receipts the past week was the free arrivals of coal. This increase no doubt is largely due to a decline in outward charters, which makes it unprofitable for deep-sea voyages. The list of vessels headed this way from Australian ports with coals is growing beautifully less. The falling off is due to the fall in outward charters at this port.

Mining Share Market.

Comstock mining shares showed more life at a slight advance on Monday, due to an increase in the battery assays of the ore milled by Con. Virginia. The spurt was short-lived, and as has been the case for weeks past, was followed by still lower prices. The market acts very much as if the stock pools have been losing stock, but who thought is an open question, for it is a well-known fact that outsiders have been steady sellers. The continued levying of assessments is accepted as evidence that the pools have lost stocks and are trying to get them back. While this may be the case, yet it is not at all unreasonable to conclude that the stock pools and mill rings recognize in the publicity during the Hale & Norcross suit of the peculiar methods in vogue on the Comstock lode for looting the mines, combined with brokers organizing against them, the death knell of the system and in lieu thereof, more honest management, and therefore they are crowding stocks down through cross orders so as to buy all they can before forced to work the mines according to the California laws under which they are incorporated. The writer still maintains his faith in a big up move in the near future, but how insiders will manipulate the market in the meantime, so as to buy stock, he does not claim to know.

If the brokers who have united to force a reform in the mine management continue in their good work, and we are assured they will, outside shareholders can reasonably look for much better times in next year. While expecting this, it is also quite certain that the rings will die hard and levy all the

assessments possible so as to discourage outside buying of stock and at the same time to force outside selling.

While our advices from the Comstock mines do not warrant the belief that any bonanza has been or will be found, yet they confirm previous statements made by us that in several of the mines they are developing to the west several levels for extracting ore from the Red lode. This lode is very rich in gold, and while not wide, yet is sufficiently so, owing to the high grade of the ore, to allow the paying of dividends provided the mill rings are compelled to mill the ore for the benefit of the mines and not that of the mills.

Brokers' proxies days are numbered, and those firms which favor it probably to sell their proxies to the highest bidder, will find that their occupation in that line will soon be gone.

Within the past six weeks, or since several of the leading brokers joined to fight the rings, there have been heavy transfers of shares, particularly of the mines against which they are making the test fight.

News from the Comstock mines continue of the most favorable character. Con. Virginia appears to be about ready to open up the west ledge on the 1750 and 1800 foot levels, towards the Best and Belcher line. Ophir is developing several levels preparatory to extracting ore. While the public's attention is drawn to the Kenosha tunnel in Sierra Nevada, very important work elsewhere in the mine is overlooked. Yet it is most too early to expect anything very important from it. In Union and Mexican prospecting and developing work is being vigorously pushed. There was a decided break in the quotations for Gould and Curry shares, which it is said is due to a more favorable condition of the mine. Both Savage and Hale and Norcross are opening up several levels which will surprise the street, provided mine looting can be prevented.

Reports are current of an improvement in Potosi. In both Potosi and Bullion important work is being done, but as the superintendent does not take an oath as to the correctness of his weekly reports, it is said he does not care particularly what he gives to the public, provided it is not favorable, while stocks are down. Chollar is said to be developing a body of ore around the 1200 foot level. The work in Ward shaft, it is said, is not correctly reported by the superintendent. In Exchequer, Alpha, Challenge, Confidence and Yellow Jacket the work is very important, particularly that not made public. Con. Imperial continues to save ore for milling. It now looks as if the management of the Yellow Jacket mine is forced to suspend milling \$7 ore at a cost of about \$15 for extracting and milling. This ore was evidently taken out for the benefit of the mill, and at the same time it afforded an excuse to assess the stock. The news from Kentucky, Belcher and Seg. Belcher is of such a character they deserve close watching. Alta is developing the rich gold find reported on the 1325 foot level. Lady Washington is preparing to run for it.

From the outside mines our advices continue favorable. The mill in the Quijote district has started up. The Bodie mill ought to start up soon. The Tuscarora companies continue to sell their high grade ore at a profit.

Mining shares opened stronger this (Wednesday) morning, and this too in the face of points for lower prices.

CALIFORNIA MANUFACTURING CO.

MINING MACHINERY FOR CONCENTRATION,
92 CHRONICLE BUILDING. SAN FRANCISCO.

We have opened our branch here with our specialties in CONCENTRATING MACHINERY and Appliances, and are prepared to investigate any proposition in the CONCENTRATION OF ORES.
Our work in COLORADO, MONTANA and IDAHO is successful, and we present mining men a proposition free from any experimental nature.
In many ways CONCENTRATING APPLIANCES IN COLORADO AND MONTANA are more successful than those at present employed on this Coast, and we think we can present a CONCENTRATOR which does not compete with any other, and that has received a cordial welcome from mining men.
Agents — W. F. ROBINSON, Boston.
GRIFFITH & WEDGE, St. Louis.
BULLOCK MFG. CO., Chicago.

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880;

September 18, 1883; July 24, 1888;

and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

Price of Improved Belt Frue Vanner, \$825, f. o. b.

ADAMS & CARTER, Agents FRUE VANNING MACHINE CO., No. 132 Market Street, San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.

Price "Triumph" Concentrators, with Plain Belt - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if need be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company, Principal Office, 401 California St., cor. Sansome, S. F. Location of Works, Grass Valley, Nevada Co., Cal. GRASS VALLEY, NEVADA CO., CAL., NOV. 10, 1886. Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices. DAVID McKAY, Jr., Signed]

Sup't North Star and Original Empire Mining Co. N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.
